¹¹⁹ **Executive Summary**

executive-summary

¹²⁰ **Stock**

stock

¹²¹ This assessment reports the status of the Yellowtail Rockfish (*Sebastodes flavidus*) resource in
¹²² U.S. waters off the coast of California, Oregon, and Washington using data through 2016.

¹²³ The Pacific Fishery Management Council (PFMC) manages the U.S. fishery as two stocks
¹²⁴ separated at Cape Mendocino, California ($40^{\circ} 10'N$). This assessment analyzes those two
¹²⁵ areas as independent stocks, with the southern stock extending southward to the U.S./Mexico
¹²⁶ border and the northern stock extending northward to the U.S./Canada border.

¹²⁷ The previous assessment (Wallace and Lai [2005](#)), following the pattern of prior assessments,
¹²⁸ included only the Northern stock which it divided into three assessment areas with divisions
¹²⁹ at Cape Elizabeth ($47^{\circ} 20'N$) and Cape Falcon ($45^{\circ} 46'N$). However, a more recent genetic
¹³⁰ analysis (Hess et al. n.d.) found distinct stocks north and south of Cape Mendocino but
¹³¹ did not find stock differences within the northern area, with the genetic stock extending
¹³² northward through British Columbia, Canada to Southeast Alaska. However, Canada and
¹³³ Alaska are not included in this assessment. Since the previous assessment, reconstruction of
¹³⁴ historical catch by Washington and Oregon makes any border but the state line incompatible
¹³⁵ with the data. Additionally, much of the groundfish catch landed in northern Oregon is
¹³⁶ caught in Washington waters.

¹³⁷ **Catches**

catches

¹³⁸ Catches from the Northern stock were divided into four categories: commercial catch, bycatch
¹³⁹ in the at-sea hake fishery, recreational catch in Oregon and California (north of $40^{\circ} 10'N$),
¹⁴⁰ and recreational catch in Washington. The first three of these fleets were entered in metric
¹⁴¹ tons, but the recreational catch from Washington was entered in the model as numbers of
¹⁴² fish with the average weight calculated internally in the model.

¹⁴³ Catches from the Southern stock were divided into two categories: commercial and recreational
¹⁴⁴ catch, both of which were entered as metric tons.

¹⁴⁵ **Include: trends and current levels-include table for last ten years and graph with long term**
¹⁴⁶ **data**

149 Data and Assessment

data-and-assessment

150 **Include:** date of last assessment, type of assessment model, data available, new information,
 151 and information lacking.

152 Yellowtail Rockfish was assessed.... This assessment uses the newest version of Stock
 153 Synthesis (3.xxx). The model begins in 1889, and assumes the stock was at an unfished
 154 equilibrium that year.

155 Map of assessment region: (Figure [c](#)).

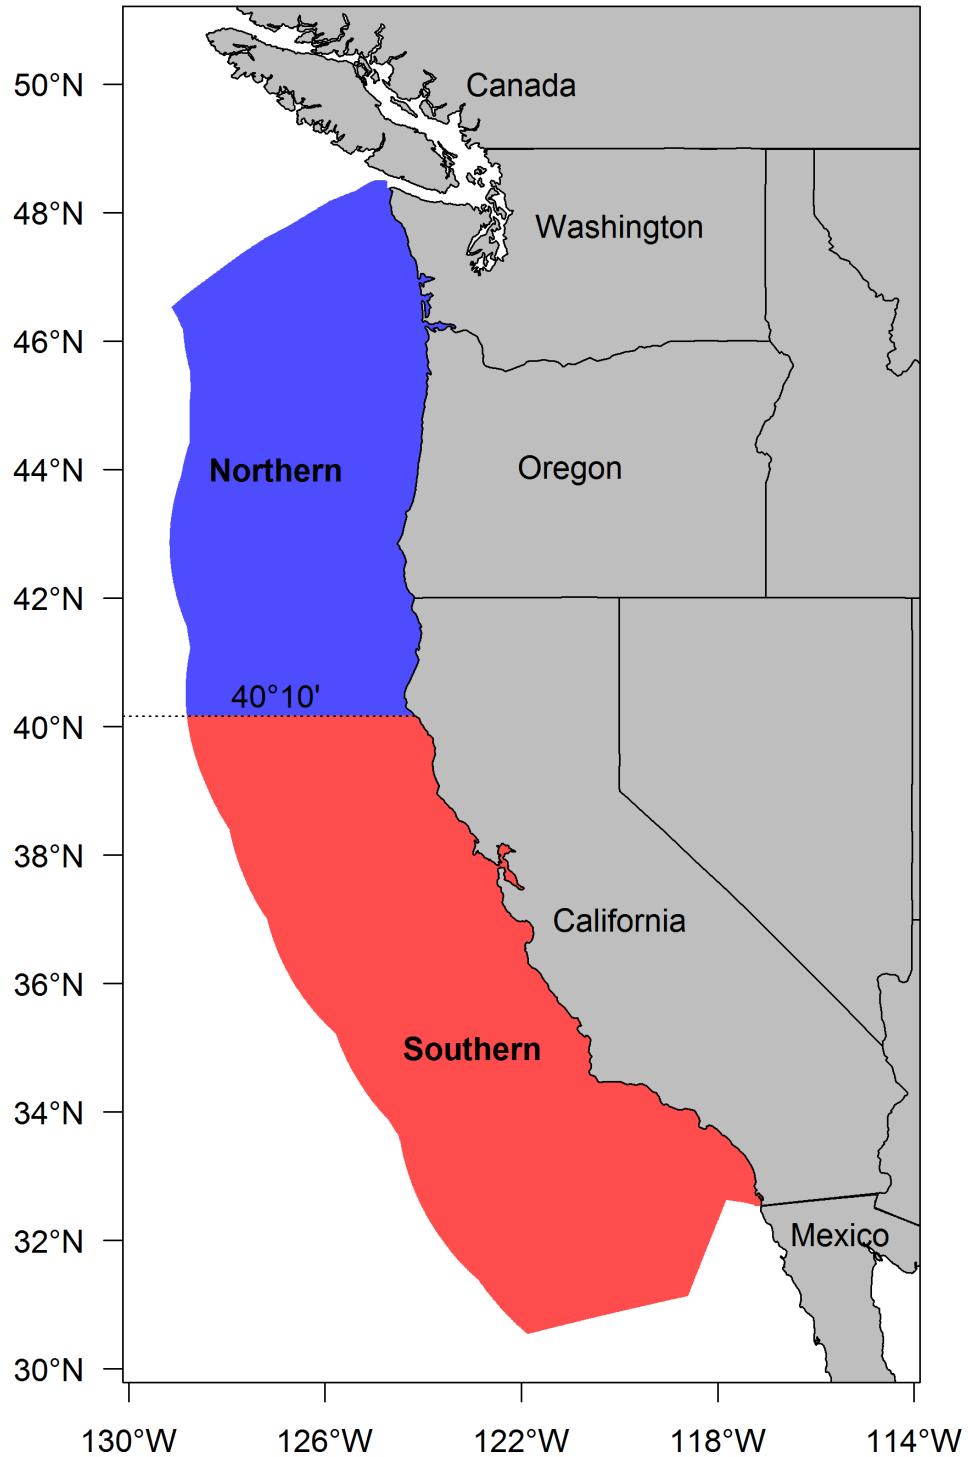

Figure c: Map depicting the boundaries for the base-case model. fig:assess_region_map_Ex

156 **Stock Biomass**

stock-biomass

157 Include: trends and current levels relative to virgin or historic levels, description of uncertainty-include table for last 10 years and graph with long term estimates.

159 Spawning output Figure: Figure [d](#)

160 Spawning output Table(s): Table [c](#)

161 Relative depletion Figure: Figure [e](#)

162 Example text (remove Models 2 and 3 if not needed - if using, remove the # in-line comments!!!)

163 The estimated relative depletion level (spawning output relative to unfished spawning output)

164 of the the base-case model in 2016 is 56.7% (~95% asymptotic interval: ± 45.4%-68.1%)

165 (Figure [e](#)).

166 The estimated relative depletion level of model 2 in 2016 is 98% (~95% asymptotic interval:

167 ± 75.5%-120%) (Figure [e](#)).

168 The estimated relative depletion level of model 3 in 2016 is (~95% asymptotic interval: ±)
169 (Figure [e](#)).

Table c: Recent trend in beginning of the year spawning output and depletion for the Northern model for Yellowtail Rockfish.

Year	Spawning Output (trillion eggs)	~ 95% confidence interval	Estimated depletion	~ 95% confidence interval
2008	7.886	(5.79-9.98)	0.547	(0.415-0.678)
2009	8.289	(6.13-10.45)	0.575	(0.442-0.707)

175 **Exploitation status**

exploitation-status

176 Include: exploitation rates (i.e., total catch divided by exploitable biomass, or the annual
177 SPR harvest rate) include a table with the last 10 years of data and a graph showing the
178 trend in fishing mortality relative to the target (y-axis) plotted against the trend in biomass
179 relative to the target (x-axis).

180 Exploitation Tables: Table [g](#), Table [h](#), Table ?? Exploitation Figure: Figure [g](#)).

181 A summary of Yellowtail Rockfish exploitation histories for base model is provided as Figure
182 [h](#).

Table g: Recent trend in spawning potential ratio and exploitation for Yellowtail Rockfish in the Northern model. Fishing intensity is (1-SPR) divided by 50% (the SPR target) and exploitation is F divided by F_{SPR} .

Year	Fishing intensity	~ 95% confidence interval	Exploitation rate	~ 95% confidence interval
2007	0.30	(0.11-0.49)	0.01	(0-0.02)
2008	0.19	(0.13-0.25)	0.01	(0-0.01)
2009	0.35	(0.22-0.48)	0.01	(0.01-0.02)
2010	0.47	(0.24-0.7)	0.02	(0.01-0.03)
2011	0.41	(0.3-0.52)	0.02	(0.01-0.02)

2016	0.01	(0-0.02)	0.00	(0-0)	

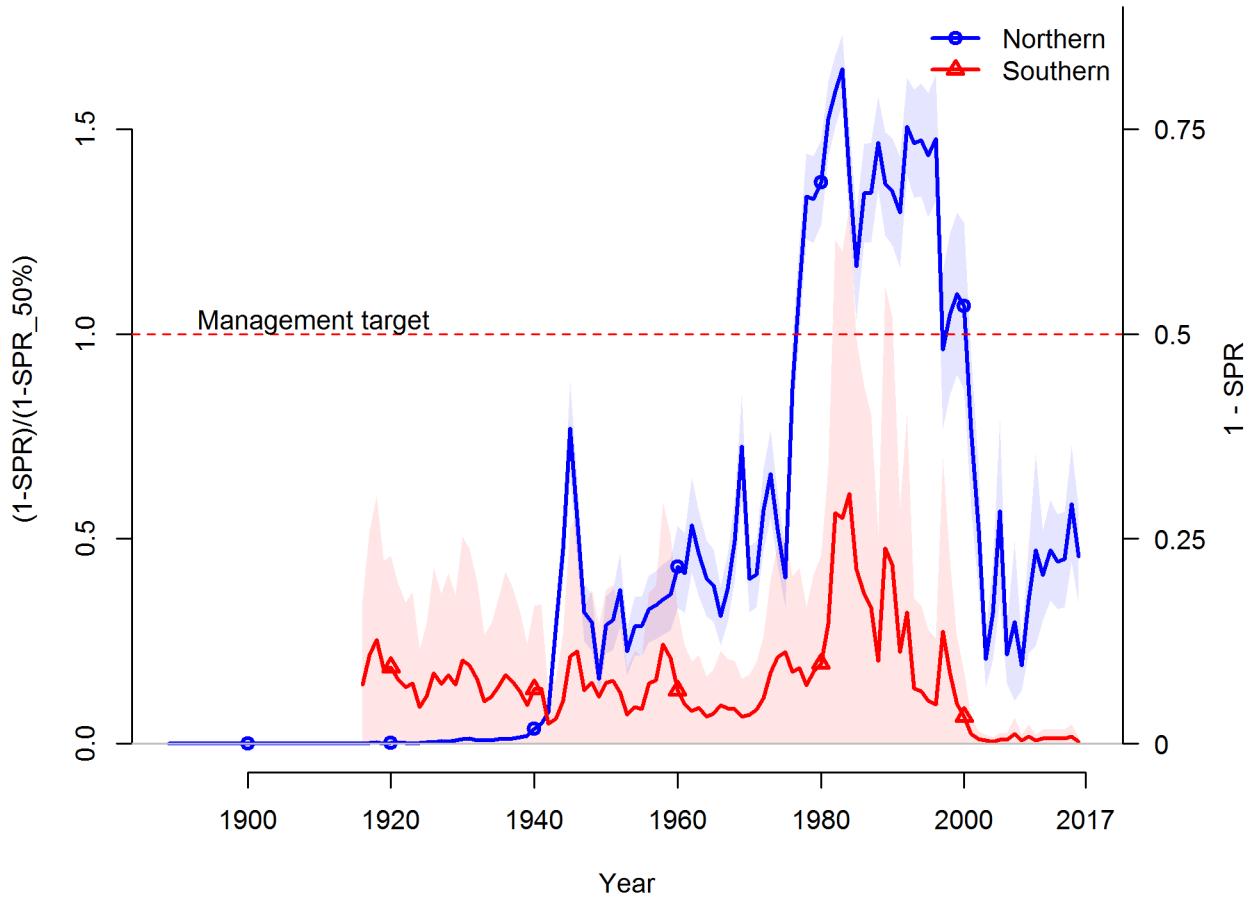

Figure g: Estimated spawning potential ratio (SPR) for the base-case model. One minus SPR is plotted so that higher exploitation rates occur on the upper portion of the y-axis. The management target is plotted as a red horizontal line and values above this reflect harvests in excess of the overfishing proxy based on the $SPR_{50\%}$ harvest rate. The last year in the time series is 2016. | [fig:SPR_all](#)

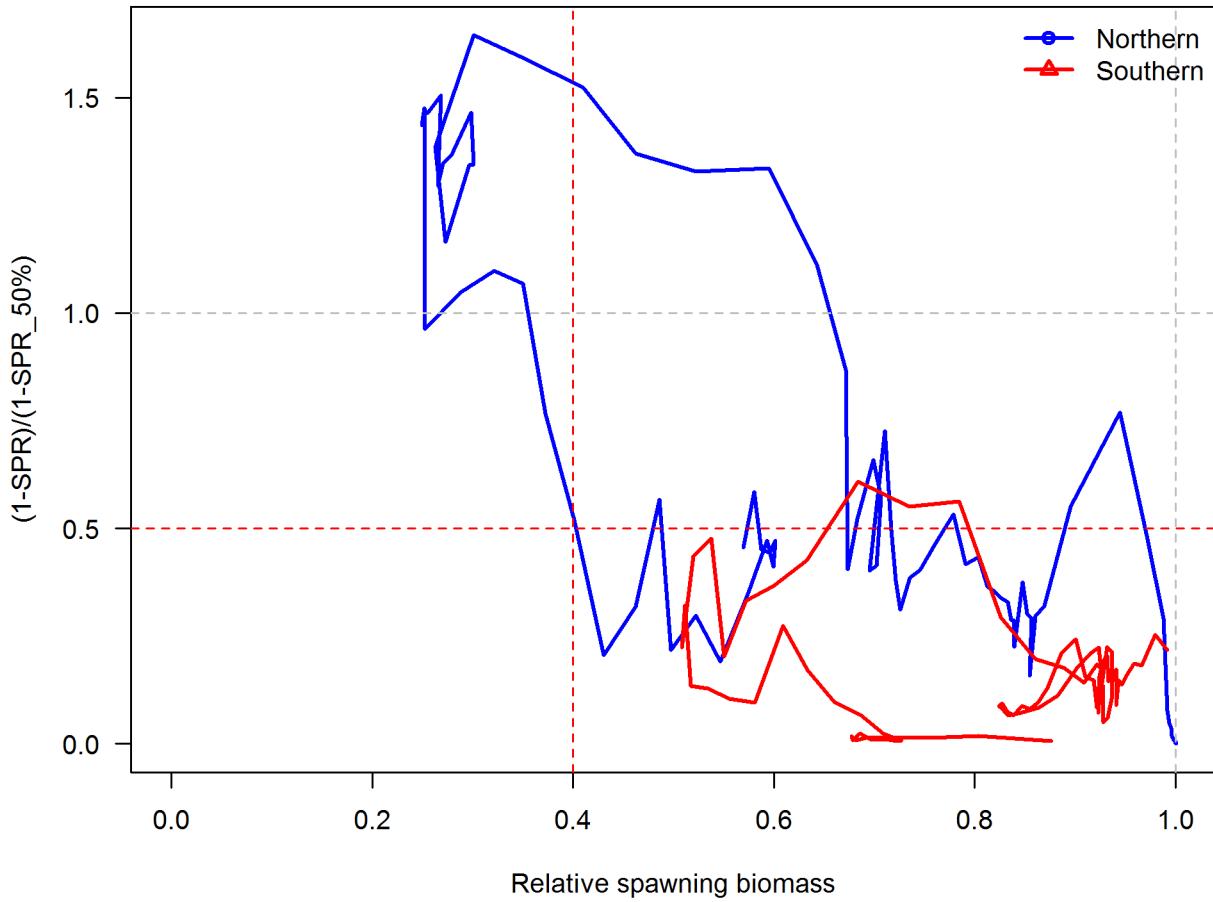

Figure h: Phase plot of estimated relative (1-SPR) vs. relative spawning biomass for the base case model. The relative (1-SPR) is (1-SPR) divided by 50% (the SPR target). Relative depletion is the annual spawning biomass divided by the unfished spawning biomass. | [fig:Phase_all](#)

183 **Ecosystem Considerations**

ecosystem-considerations

184 In this assessment, ecosystem considerations were. . . .

185 **Reference Points**

reference-points

186 **Include:** management targets and definition of overfishing, including the harvest rate that
187 brings the stock to equilibrium at $B_{40\%}$ (the B_{MSY} proxy) and the equilibrium stock size
188 that results from fishing at the default harvest rate (the F_{MSY} proxy). Include a summary
189 table that compares estimated reference points for SSB, SPR, Exploitation Rate and Yield
190 based on SSBproxy for MSY, SPRproxy for MSY, and estimated MSY values

191 Write intro paragraph....and remove text for Models 2 and 3 if not needed

192 This stock assessment estimates that Yellowtail Rockfish in the Northern model are above the
193 biomass target, but above the minimum stock size threshold. Add sentence about spawning
194 output trend. The estimated relative depletion level for Model 1 in 2016 is 56.7% (~95%
195 asymptotic interval: $\pm 45.4\%-68.1\%$, corresponding to an unfished spawning output of 8.18588
196 trillion eggs (~95% asymptotic interval: 5.9-10.47 trillion eggs) of spawning output in the
197 base model (Table i). Unfished age 4+ biomass was estimated to be 132.7 mt in the base
198 case model. The target spawning output based on the biomass target ($SB_{40\%}$) is 5.8 trillion
199 eggs, which gives a catch of 4116.9 mt. Equilibrium yield at the proxy F_{MSY} harvest rate
200 corresponding to $SPR_{50\%}$ is 3882.8 mt.

201 This stock assessment estimates that Yellowtail Rockfish in the Southern model are above
202 the biomass target, but above the minimum stock size threshold. Add sentence about
203 spawning output trend. The estimated relative depletion level for Model 2 in 2016 is 98%
204 (~95% asymptotic interval: $\pm 75.5\%-120\%$), corresponding to an unfished spawning output
205 of 5.68452 trillion eggs (~95% asymptotic interval:) of spawning output in the base model
206 (Table j). Unfished age 4+ biomass was estimated to be 117.6 mt in the base case model. The
207 target spawning output based on the biomass target ($SB_{40\%}$) is 2.3 trillion eggs, which gives
208 a catch of mt. Equilibrium yield at the proxy F_{MSY} harvest rate corresponding to $SPR_{50\%}$
209 is 3136.4 mt.

210 This stock assessment estimates that Yellowtail Rockfish in the are

211 the biomass target, but
212 the minimum stock size threshold. Add sentence about spawning output trend. The estimated
213 relative depletion level or Model 3 in 2016 is (~95% asymptotic interval: \pm), corresponding
214 to an unfished spawning output of (~95% asymptotic interval:) of spawning output in the
215 base model (Table ??). Unfished age 4+ biomass was estimated to be mt in the base case
216 model. The target spawning output based on the biomass target ($SB_{40\%}$) is , which gives a
217 catch of mt. Equilibrium yield at the proxy F_{MSY} harvest rate corresponding to $SPR_{50\%}$ is
218 mt.

Table i: Summary of reference points and management quantities for the base case Northern model.

Quantity	Estimate	<small>tab:Ref_pts_mod1</small> 95% Confidence Interval
Unfished spawning output (trillion eggs)	14.4	(12.2-16.7)
Unfished age 4+ biomass (1000 mt)	132.7	(113.8-151.7)
Unfished recruitment (R0, millions)	30.3	(21.2-39.5)
Spawning output(2016 trillion eggs)	8.2	(6-10.5)
Relative Spawning Biomass (depletion)2016)	0.5694	(0.4547-0.6842)
Reference points based on SB_{40%}		
Proxy spawning output ($B_{40\%}$)	5.8	(4.9-6.7)
SPR resulting in $B_{40\%}$ ($SPR_{B40\%}$)	0.4589	(0.4589-0.4589)
Exploitation rate resulting in $B_{40\%}$	0.0545	(0.0521-0.0568)
Yield with $SPR_{B40\%}$ at $B_{40\%}$ (mt)	4116.9	(3434-4799.7)
Reference points based on SPR proxy for MSY		
Spawning output	6.4	(5.4-7.4)
SPR_{proxy}	0.5	
Exploitation rate corresponding to SPR_{proxy}	0.0483	(0.0462-0.0504)
Yield with SPR_{proxy} at SB_{SPR} (mt)	3882.8	(3242-4523.6)
Reference points based on estimated MSY values		
Spawning output at MSY (SB_{MSY})	3.4	(2.8-3.9)
SPR_{MSY}	0.3094	(0.3046-0.3142)
Exploitation rate at MSY	0.0833	(0.0793-0.0872)
MSY (mt)	4596.2	(3816-5376.4)

Table j: Summary of reference points and management quantities for the base case Southern model.

Quantity	Estimate	<small>tab:Ref_pts_mod2</small>	95% Confidence Interval
Unfished spawning output (trillion eggs)	5.8		(-3.1787-14.8)
Unfished age 4+ biomass (1000 mt)	117.6		(-63.5774-298.8)
Unfished recruitment (R0, millions)	37.3		(-20.3528-95)
Spawning output(2016 trillion eggs)	5.1		(-3.4779-13.6)
Relative Spawning Biomass (depletion)2016)	0.8763		(0.6849-1.1)
Reference points based on SB_{40%}			
Proxy spawning output ($B_{40\%}$)	2.3		(-1.2714-5.9)
SPR resulting in $B_{40\%}$ ($SPR_{B40\%}$)	0.4589		(0.4589-0.4589)
Exploitation rate resulting in $B_{40\%}$	0.0579		(0.0564-0.0595)
Yield with $SPR_{B40\%}$ at $B_{40\%}$ (mt)	3314		(-1804.9955-8432.9)
Reference points based on SPR proxy for MSY			
Spawning output	2.6		(-1.4163-6.6)
SPR_{proxy}	0.5		
Exploitation rate corresponding to SPR_{proxy}	0.0511		(0.0497-0.0524)
Yield with SPR_{proxy} at SB_{SPR} (mt)	3136.4		(-1707.975-7980.7)
Reference points based on estimated MSY values			
Spawning output at MSY (SB_{MSY})	1.4		(-0.7714-3.6)
SPR_{MSY}	0.3172		(0.3138-0.3206)
Exploitation rate at MSY	0.0891		(0.0869-0.0913)
MSY (mt)	3649		(-1988.6596-9286.7)

²¹⁹ **Management Performance**

management-performance

²²⁰ **Include:** catches in comparison to OFL, ABC and OY/ACL values for the most recent 10 years (when available), overfishing levels, actual catch and discard. Include OFL(encountered), OFL(retained) and OFL(dead) if different due to discard and discard mortality.

²²³ Management performance table: Table [k](#)

Table k: Recent trend in total catch and commercial landings (mt) relative to the management guidelines. Estimated total catch reflect the commercial landings plus the model estimated discarded biomass.

Year	OFL (mt; ABC prior to 2011)	ABC (mt)	ACL (mt; OY prior to 2011)	Estimated total catch (mt)

²³² **Research And Data Needs**

research-and-data-needs

²³³ Include: identify information gaps that seriously impede the stock assessment.

²³⁴ We recommend the following research be conducted before the next assessment:

²³⁵ 1. List item No. 1 in the list

²³⁶ 2. List item No. 2 in the list, etc.

²³⁷ **Rebuilding Projections**

rebuilding-projections

²³⁸ Include: reference to the principal results from rebuilding analysis if the stock is overfished.

²³⁹ This section should be included in the Final/SAFE version assessment document but is not

²⁴⁰ required for draft assessments undergoing review. See Rebuilding Analysis terms of reference

²⁴¹ for detailed information on rebuilding analysis requirements.

242 **1 Introduction**

introduction

243 **1.1 Basic Information**

basic-information

244 Yellowtail rockfish, *Sebastodes flavidus*, occur off the West Coast of the United States from Baja
245 California to the Aleutian Islands. Yellowtail is a major commercial species, captured mostly
246 in trawls from Central California to British Columbia([Love 2011](#)). Yellowtail rockfish is an
247 aggregating, midwater species usually caught between 60 and 120 fathoms. Off Washington
248 and Oregon, they are largely caught in the commercial trawl fishery; in California there is a
249 large recreational fishery as well.

250 Yellowtail rockfish are among the many species that have been seen to increase in both
251 abundance and in average size ([Marks et al. 2015](#)) following the implementation of Rockfish
252 Conservation Areas (RCAs), areas closed to fishing since 2002. Once thought to comprise a
253 single stock, a recent genetic study has shown that there are in fact two sub-species, with a
254 genetic cline at Cape Mendocino, California, roughly 40-10 North Latitude([Hess et al. n.d.](#)).
255 The species has never had a full assessment south of Cape Mendocino, mainly due to a lack
256 of fishery-independent data; this assessment represents the first attempt to do so.

257 Yellowtail rockfish are colloquially known as “greenies”, although *flavidus* is Latin for
258 “yellow”([Love 2011](#)).

259 **1.2 Map**

map

260 A map showing the scope of the assessment and depicting boundaries for fisheries or data
261 collection strata is provided in Figure ??.

262 **1.3 Life History**

life-history

263 Yellowtail rockfish are among those that are fertilized internally and release live young.
264 Spawning aggregations occur in the fall, and parturition in the winter and spring (January-
265 May)([Eldridge et al. 1991](#)). Young-of-the-year recruit to nearshore waters from April through
266 August, migrating to deeper water in the fall. Preferred habitat is the midwater over reefs
267 and boulder fields. They are extremely motile, and make rapid and frequent ascents and
268 descents of 40 meters; they also exhibit strong homing tendencies([Love 2011](#)). They are able
269 to quickly release gas from their swim bladders, perhaps making them less susceptible to
270 barotrauma than similar species([Eldridge et al. 1991](#)). Yellowtail rockfish can live to at least
271 64 years([Love 2011](#)).

272 **1.4 Fishery and Management History**

fishery-and-management-history

273 The rockfish fishery off the U.S. Pacific coast first developed off California in the late 19th
274 century as a hook-and-line fishery (Love et al. 2002). The rockfish trawl fishery was established
275 in the early 1940s, when the United States became involved in World War II and wartime
276 shortage of red meat created an increased demand for other sources of protein (Harry and
277 Morgan 1961, Alverson et al. 1964).

278 Until late 2002, yellowtail rockfish were harvested as part of a directed mid-water trawl
279 fishery, with fairly high landings in the 1980s and 1990s. Yellowtail commonly co-occur
280 with canary, widow rockfish and several other rockfishes (??); (??); (Rogers and Pikitch
281 1992). Association with these and other rockfish species has substantially altered fishing
282 opportunity for yellowtail rockfish since canary rockfish stocks were declared overfished by
283 National Marine Fisheries service in YEAR. In order to achieve the necessary reduction
284 in the canary rockfish catch, stringent management measures were adopted beginning in
285 2000. This limited harvest of yellowtail rockfish as well as other co-occurring species, and
286 has greatly decreased removals over the last decade.

287 Beginning in 2000, shelf rockfish species could no longer be retained by vessels using bottom
288 trawl footropes with a diameter greater than 8 inches. The use of small footrope gear increases
289 the risk of gear loss in rocky areas. This restriction was intended to provide an incentive
290 for fishers to avoid high-relief, rocky habitat, thus reducing the exposure of many depleted
291 species to trawling. This incentive was reinforced through reductions in landing limits for
292 most shelf rockfish species.

293 Since September 2002, managers have additionally employed closed areas called as Rockfish
294 Conservation Areas (RCAs). Additional limits on landings were designed so as to accommo-
295 date incidental bycatch only. These eliminated directed mid-water fishing opportunities for
296 yellowtail rockfish in non-tribal trawl fisheries. A somewhat greater opportunity to target
297 yellowtail rockfish in the trawl fishery has been available since 2011 under the trawl rational-
298 ization program, however low quotas for widow and canary rockfish and other constraining
299 stocks continue to limit targeting of yellowtail rockfish. With the recent improved status of
300 widow and canary rockfish, the industry is developing strategies to better attain allocations
301 of yellowtail and widow rockfish.

302 Yellowtail rockfish are currently managed with stock-specific harvest specifications north
303 of 40.10 N. latitude, and as part of the Southern Shelf Rockfish complex south of 40.10 N.
304 latitude. The OFL contribution of yellowtail rockfish to the Southern Shelf Rockfish complex
305 is based on a data-moderate analysis (Cope et al. 2013).

306 **1.5 Assessment History**

assessment-history

307 Yellowtail rockfish on the U.S. West Coast north of 40.10 N. latitude were assessed in 1984
308 (???, 1986(Coleman 1986), 1988 (???, 1993(???, 1996 (???, and 1997 (Tagart et al. 1997)
309 to determine harvest specifications for the stock. A full assessment in 2000 (Tagart et al.
310 2000) was the first that estimated stock status, with an estimated depletion of 60.5 percent
311 at the start of 2000. Lai et al. (Lai et al. 2003) updated the 2000 assessment and estimated
312 that stock depletion was 46 percent at the start of 2003. A second assessment update was
313 prepared in 2005 (Wallace and Lai 2005) with an estimated depletion of 55 percent at the
314 start of 2005.

315 A data-moderate assessment of yellowtail rockfish north of 40.10 N. latitude was conducted
316 in 2013(Cope et al. 2013). This assessment estimated depletion at the start of 2013 at 67
317 percent, and estimated the spawning biomass at 50,043 mt. This was a large biomass increase
318 relative to previous estimates and may be attributed to the low removals over the previous
319 decade.

320 \hl{Include: Management performance tables comparing Overfishing Limit (OFL), Annual
321 Catch Limit (ACL), Harvest Guideline (HG) [CPS only], landings, and catch (i.e., landings
322 plus discard) for each area and year. Management performance table: (Table k)
323 A summary of these values as well as other base case summary results can be found in Table
324 O.

325 **1.6 Fisheries off Canada, Alaska, and/or Mexico**

fisheries-off-canada-alaska-andor-mexico

326 The 2015 Stock Assessment conducted by the Department of Fisheries and Oceans (DFO)
327 found the stock to be at 0.49B0, in the “healthy” range.

328 The Alaska Fisheries Science Center assesses yellowtail rockfish as one of 25 species in the
329 “Other Rockfish” complex in the Gulf of Alaska. The 2015 full assessment of this complex
330 found no evidence of overfishing, which is confirmed in the 2016 SAFE document(???).

331 Limited fishing for yellowtail occurs as far south as Baja California(Love 2011).

³³² 2 Data

data

³³³ Data used in the Northern and Southern yellowtail rockfish assessments are summarized in
³³⁴ Figures 54 and 54.

³³⁵ Data sources for the two models are largely distinct. Northern fisheries and surveys had very
³³⁶ sparse data (if any) for the south and vice-versa. Among the 12 data sources referenced
³³⁷ below, only 2 data sources are common to both models. These are the MRFSS/RecFIN
³³⁸ recreational dockside survey, which focuses on California and Oregon, and the CalCOM
³³⁹ California commercial dataset, which contributed data from the northern-most California
³⁴⁰ counties (Eureka and Del Norte) to the Northern model. The CalCOM data account for less
³⁴¹ than five percent of the commercial landings in the Northern model, and less than 1% of the
³⁴² biological samples.

³⁴³ Commercial landings are not differentiated in either model. For the Northern model, this is
³⁴⁴ due to the very small portion (1.15 %) of the landings that are attributed to non-trawl gear.
³⁴⁵ For the Southern model, this is due to the paucity of data.

³⁴⁶ A description of each model's data sources follows.

³⁴⁷ 2.1 Northern Model Data

northern-model-data

Summary of the data sources in the Northern model.

NWFSCcombo		Y	Y	Y		Survey	
Pikitch		Y			Y	Commercial Study	
ODFW	Y					Historical data	
WDFW	Y					Historical data	

³⁴⁸ **2.1.1 Commercial Fishery Landings**

commercial-fishery-landings

³⁴⁹ **Washington and Oregon Landings** The bulk of the commercial landings for Washington
³⁵⁰ and Oregon came from the Pacific Fisheries Information Network (**PacFIN**)
³⁵¹ database.

³⁵² **Washington Catch Information**

³⁵³ The Washington Department of Fisheries and Wildlife (**WDFW**) provided historical yellow-
³⁵⁴ tail catch for 1889–1980. Landings for 1981-2016 came from the PacFIN database. WDFW
³⁵⁵ also provided catches for the period 1981 – 2016 to include the re-distribution of the un-
³⁵⁶ speciated “URCK” landings in PacFIN; this information is currently not available from
³⁵⁷ PacFIN.

³⁵⁸ **Oregon Catch Information**

³⁵⁹ The Oregon Department of Fisheries and Wildlife (**ODFW**) provided historical yellowtail
³⁶⁰ catch from 1892-1985. ODFW also provided estimates of yellowtail rockfish in the in the
³⁶¹ un-speciated PacFIN “URCK” and “POP1” catch categories for recent years, and those
³⁶² estimates were combined with PacFIN landings for 1986-2016.

³⁶³ **Northern California Catch**

³⁶⁴ The California Commercial Fishery Database (**CalCOM**) provided landings for the Northern
³⁶⁵ model for the two counties north of 40.10 (Eureka and Del Norte) for 1969-2016.

³⁶⁶ **Hake Bycatch**

³⁶⁷ The Alaska Fisheries Science Center (**AFSC**) provided data for yellowtail bycatch in the
³⁶⁸ hake fishery from 1976-2016.

³⁶⁹ **2.1.2 Sport Fishery Removals**

sport-fishery-removals

³⁷⁰ **Washington Sport Catch**

³⁷¹ WDFW provided recreational catches for 1967 and 1975-2016.

³⁷² **Oregon Sport Catch**

³⁷³ ODFW provided recreational catch data for 1979-2016.

³⁷⁴ **MRFSS and RecFIN** Data from Northern California came from the Marine Recreational
³⁷⁵ Fisheries Statistical Survey (**MRFSS**) and from the Recreational Fisheries Information
³⁷⁶ Network (**RecFIN**). These are dockside surveys focused on California and Oregon. MRFSS
³⁷⁷ was conducted from 1980-1989 and 1993-2003, RecFIN from 2004 to the present.

³⁷⁸ **2.1.3 Estimated Discards**

`estimated-discards`

³⁷⁹ **Commercial Discards**

³⁸⁰ The West Coast Groundfish Observing Program (**WCGOP**) is an onboard observer program
³⁸¹ that has extensively surveyed fishing practices since 2002, with nearly 100% observer coverage
³⁸² in the trawl sector in recent years. WCGOP provided discard ratios for yellowtail rockfish
³⁸³ from 2002 to 2015.

³⁸⁴ **Pikitch Study**

³⁸⁵ The Pikitch study was conducted between 1985 and 1987 (Pikitch et al. [1988](#)). The northern
³⁸⁶ and southern boundaries of the study were 48°42' N latitude and 42°60' N. latitude respectively,
³⁸⁷ which is primarily within the Columbia INPFC area (Pikitch et al. [1988](#), Rogers and Pikitch
³⁸⁸ [1992](#)).

³⁸⁹ Participation in the study was voluntary and included vessels using bottom, midwater, and
³⁹⁰ shrimp trawl gears. Observers of normal fishing operations on commercial vessels collected
³⁹¹ the data, estimated the total weight of the catch by tow and recorded the weight of species
³⁹² retained and discarded in the sample.

³⁹³ Pikitch study discards were aggregated due to small sample size and included in the data as
³⁹⁴ representing a single year mid-way through the study.

³⁹⁵ **2.1.4 Abundance Indices**

`abundance-indices`

³⁹⁶ **Commercial Logbook CPUE**

³⁹⁷ The commercial logbook (fish-ticket) data in PacFIN was used to generate an index for the
³⁹⁸ years 1987-1998, a period in which management of the fishery was stable, i.e., regulations
³⁹⁹ weren't changing fishery practices.

⁴⁰⁰ The data were modeled with a modified Stephens-MacCall approach (Stephens and MacCall
⁴⁰¹ [2004](#)). This approach uses the species composition of the catch to evaluate the per-haul
⁴⁰² probability of encountering a particular species; in this case, yellowtail rockfish. The intent
⁴⁰³ of the analysis is to eliminate all hauls from the index that could not encounter yellowtail.

⁴⁰⁴ Usually, the Stephens-MacCall approach is a simple binomial model for presence-absence of
⁴⁰⁵ the predictive species and the target, however a generalized linear mixed-effects approach –
⁴⁰⁶ modeling the species as binomial and adding random effects for the interaction of year and
⁴⁰⁷ vessel, for haul duration, and for month improved the model fit.

⁴⁰⁸ The hauls identified with a reasonable probability of encountering yellowtail were then
⁴⁰⁹ modeled in a delta-lognormal glm to produce an annual index of abundance, bootstrapped
⁴¹⁰ 500 times to evaluate uncertainty.

411 **Hake Bycatch Index**

412 The Hake bycatch data provided by the Alaska Fisheries Science Center (AFSC) was used to
413 generate an index of abundance for 1985-1999.

414 Data on haul-by-haul catch of Yellowtail Rockfish and Pacific Hake for the period 1976-2016
415 were obtained from the At-Sea Hake Observer Program along associated information including
416 the location of each tow and the duration. Previous Yellowtail assessments used an index
417 of abundance for the years 1978-1999. The most recent assessment (Wallace and Lai, 2005)
418 stated that the index was not updated to include years beyond 1999 “because subsequent
419 changes in fishery regulations and behavior have altered the statistical properties of these
420 abundance indices”. The ending year of 1999 was retained for this analysis. However, the
421 years up to 1984 have relatively few tows with adequate information for CPUE analysis, and
422 fishing effort off the coast of Washington where yellowtail are most commonly encountered
423 (Figure 12). Therefore, for this new analysis, 1985 was chosen as the starting year.

424 The hake fishery was evolving during the chosen 15 year period (1985-1999), which included a
425 transition from foreign to domestic fleets fishing for Pacific Hake (Figure 13). The index from
426 the at-sea hake fishery used in previous assessments standardized for changes in catchability
427 by using a ratio estimator relating yellowtail catch to hake catch and then scaling by an
428 estimate of fishing effort for hake (Equation 1 in Wallace and Lai, 2005). However, that
429 approach does not take into account differences in the spatial distribution of the at-sea hake
430 fishery relative to the distributions of hake and yellowtail.

431 For this new analysis, changes in catchability were estimated by comparing an index based
432 on a geostatistical analysis of the hake CPUE from VAST (Thorson et al. YYYY) to the
433 estimated available hake biomass from the most recent stock assessment (Berger et al. 2017).
434 The relative catchability was then used to adjust an independent geostatistical index of
435 yellowtail CPUE (Figure 14). In order to capture the general trend in catchability, reducing
436 the variability among years, linear, exponential, and locally smoothed (LOWESS) models
437 were fit to the time series of individual estimates of hake index to available biomass (lower
438 panel in Figure 14). Of these, the LOWESS model best captured the pattern of fastest change
439 in the middle of the time series. The average rate of increase in the resulting estimated
440 catchability time series is 13% per year.

441 VAST was then used to conduct a geostatistical standardization of the CPUE of yellowtail
442 caught as bycatch in the at-sea hake fishery. The resulting yellowtail index after adjustment
443 by the estimated changes in catchability is qualitatively more similar to the index used in
444 previous assessments (Figure 15) than the index resulting from assuming constant catchability.

445 **2.1.5 Fishery-Independent Data**

fishery-independent-data

446 **Northwest Fisheries Science Center (NWFSC) shelf-slope survey**

447 This survey, referred to as the **NWFSCcombo Survey**, has been conducted annually
448 starting in 2003. It uses a random-grid design covering the coastal waters from a depth
449 of 55 m to 1,280 m from late-May to early-October (add reference: Bradburn 2011). Four
450 chartered industry vessels are used each year (with the exception of 2013 when the U.S.
451 federal government shutdown curtailed the survey).

452 The data from the NWFSCcombo survey was analyzed using a spatio-temporal delta-model
453 (add reference: Thorson2015), implemented as an R package VAST (add reference: Thor-
454 son2017) and publicly available online (<https://github.com/James-Thorson/VAST>). Spatial
455 and spatio-temporal variation is specifically included in both encounter probability and
456 positive catch rates, a logit-link for encounter probability, and a log-link for positive catch
457 rates. Vessel-year effects were included for each unique combination of vessel and year in the
458 database.

459 Both lognormal and gamma distributions were explored for the positive tows and produced
460 similar results with the lognormal model showing better patterns in Q-Q plot. The index
461 shows variability with an overall gradual increase from 2003 to 2013 with high estimates near
462 the end of the time series in 2014 and 2016. A design-based index extrapolated from swept
463 area densities without any geostatistical standardization shows a more dramatic increase
464 from 2015 to 2016.

465 Length and age compositions were also developed from this survey.

466 **Alaska Fisheries Science Center (AFSC) Triennial shelf survey**

467 The **Triennial Survey** was conducted by the AFSC every third year between 1977 and 2001,
468 (and was conducted in 2004 by the NWFSC using the same protocols). The 1977 survey
469 had incomplete coverage and is not believed to be comparable to the later years. The survey
470 design used equally-spaced transects from which searches for tows in a specific depth range
471 were initiated. The depth range and latitudinal range was not consistent across years, but
472 all years in the period 1980-2004 included the area from 40° 10'N north to the Canadian
473 border and a depth range that included 55-366 meters, which spans the range where the vast
474 majority of Yellowtail encountered in all trawl surveys. Therefore the index was based on
475 this depth range.

476 An index of abundance was estimated based on the VAST delta-GLMM model as described
477 for the NWFSCcombo Index above. In this case as well, Q-Q plots indicated slightly better
478 performance of the lognormal over gamma models for positive tows. The index shows a
479 gradual decline from 1980 to 1992 followed by high variability in the final 4 points spanning
480 1995-2004.

⁴⁸¹ **2.1.6 Biological Samples**

`biological-samples`

⁴⁸² **Length And Age Compositions**

⁴⁸³ Length composition data were compiled from PacFIN for Oregon and Washington for the
⁴⁸⁴ Northern model and combined with raw (unexpanded) length data from CalCOM for the
⁴⁸⁵ two California counties north of 40° 10'N (Eureka and Del Norte counties).

⁴⁸⁶ Length compositions were provided from the following sources:

Summary of the time series of lengths used in the stock assessment.

Source	Type	Lengths	Tows	Years

489 **2.2.1 Commercial Fishery Landings**

commercial-fishery-landings-1

490 **California Commercial Landings**

491 The California Commercial Fishery Database (**CalCOM**) provided landings in California
492 south of 40° 10'N for 1969-2016.

493 **2.2.2 Sport Fishery Removals**

sport-fishery-removals-1

494 **MRFSS Estimates and RecFIN**

495 The California Department of Fish and Wildlife (**CDFW**) provided estimated yellowtail
496 removals for the Marine Recreational Fisheries Statistical Survey (**MRFSS**) from 1980-1989,
497 1993-2003. The Recreational FIsheries Information Network, (**RecFIN**) provided landings
498 for 2004-2016.

499 **Small Research Study** A small number of fish were collected from the recreational fishery
500 by the Southwest Fisheries Science Center (**SWFSC**) and are included in the data for
501 1978-1984.

502 **2.2.3 Estimated Discards**

estimated-discards-1

503 No discard data were available for the Southern model.

504 **2.2.4 Abundance Indices**

abundance-indices-1

505 **MRFSS Index**

506 An index of abundance was developed from trip-aggregated MRFSS data for the years
507 1980-1989, 1992-2003.

508 **California Onboard Survey**

509 An Onboard recreational survey conducted by provided data for an index of abundance
510 provided by the SWFSC for 1987-2016.

511 **2.2.5 Fishery-Independent Data**

fishery-independent-data-1

512 **Hook and Line Survey**

513 The NWFSC Hook and Line survey provided data for an index in the Southern California
514 Bight from 2004-2016.

515 **2.2.6 Biological Samples**

biological-samples-1

516 Length composition samples were available for the Southern model from 5 sources, and ages
517 from 3.

518 Length compositions were provided from the following sources:

Summary of the time series of lengths used in the stock assessment.

Source	Type	Lengths	Tows	Years	tab:Length_sources

CalCOM	commercial	7875	1980-2004	
Small Study	recreational	400	1978-1984	
Hook and Line	survey	248	2004	

520 **2.3 Biological Parameters Common to Both Models**

biological-parameters-common-to-both-models

521 **Aging Precision And Bias**

522 Age error matrices were developed for double-reads at the PFMC aging lab in Newport, OR
523 and for double reads within the WDFW aging lab. The Newport lab has done all of the
524 Survey aging for the NWFSC, along with some commercial ages and the 400 fish from the
525 Small Study. WDFW provided the bulk of recreational and commercial ages. Between-lab
526 differences in aging were minute, as were within-lab differences. This result is supported
527 by the primary age reader's assessment: yellowtail rockfish are extremely easy to age (B.
528 Kamikawa, pers. comm.).

529 **Weight-Length**

530 The weight-length relationship is based on the standard power function: $W = \alpha(L^\beta)$ where
531 W is individual weight (kg), L is length (cm), and α and β are coefficients used as constants.

532 To estimate this relationship, 12,778 samples with both weight and length measurements
533 from the fishery independent surveys were analyzed. These included 6,354 samples from
534 the NWFSC Combo survey, 5,085 from the Triennial survey, and 1,339 from the Hook and
535 Line survey. All Hook and Line survey samples were from the Southern area, along with
536 910 samples from the other two surveys (Figure 4). A single weight-length relationship was
537 chosen for females and males in both areas after examining various factors that may influence
538 this relationships, including sex, area, year, and season. None of these factors had a strong
539 influence in the overall results. Season was one of the bigger factors, with fish sampled later
540 in the year showing a small increase in weight at a given length (2-6% depending on the
541 other factors considered). However, season was confounded with area because most of the
542 samples from the Southern area were collected from the Hook and Line survey which takes
543 place later in the year (mid-September to mid-November) and the resolution of other data in
544 the model do not support modeling the stock at a scale finer than a annual time step. Males
545 and females did not show strong differences in either area, and the estimated differences were
546 in opposite directions for the two areas, suggesting that this might be a spurious relationship
547 or confounded with differences timing of the sampling relative to spawning.

548 The estimated coefficients resulting from this analysis were $\alpha = 1.1843e - 05$ and $\beta = 3.0672$.

549 **Maturity And Fecundity** Maturity was estimated from histological analysis of

550 141 samples collected in 2016. These include 96 from the NWFSC Combo survey, 25 from
551 mid-water catches in the NWFSC acoustic/trawl survey, 13 from the Hook and Line survey,
552 and 7 from Oregon Department of Fish and Wildlife. The sample sizes were not adequate to
553 estimate differences in maturity by area. Length at 50% maturity was estimated at 42.49cm

⁵⁵⁴ (Figure ??) which was consistent with the range 37-45cm cited in the previous assessment
⁵⁵⁵ (Wallace and Lai 2005).

⁵⁵⁶ **Natural Mortality**

⁵⁵⁷ Natural mortality estimates used as priors for the Northern model and as fixed values for the
⁵⁵⁸ Southern model were provided by Owen Hamel (pers. comm.).

⁵⁵⁹ **Sex ratios**

⁵⁶⁰ The largest fish seen in the data are females, however the oldest are males. The sex ratio
⁵⁶¹ falls off differently in each model, as can be seen in Figs(x,y).

⁵⁶² **2.3.1 Environmental Or Ecosystem Data Included In The Assessment**
environmental-or-ecosystem-data-included-in-the-assessment

⁵⁶³ No environmental index is present in either model.

564 **3 Assessment**

assessment

565 **3.1 History Of Modeling Approaches Used For This Stock**

history-of-modeling-approaches-used-for-this-stock

566 Yellowtail rockfish was previously modeled as a 3-area stock north of 40.10 using a model
567 written in ADMB need citation in 1999. Need citation, with an update assessment in
568 2004(Wallace and Lai 2005). That assessment divided the stock into 3 INPFC areas which
569 are not coincident with state boundaries; this is a concern in that recent reconstructions
570 of historical catch are state-by-state along the West Coast. Because we cannot produce
571 data that conform to the areas previously assessed, we have made no effort to reproduce the
572 previous model.

573 **3.1.1 Previous Assessment Recommendations**

previous-assessment-recommendations

574 Many of the recommendations of the previous STAR panel are not relevant to this assessment,
575 as they related to data deficiencies at that time that have since been resolved. The 2004
576 STAR particularly recommended a focus on abundance indices, which they noted might
577 require further survey information.

578 This assessment provides four indices for the Northern model, and three for the Southern
579 model. All indices are newly developed for this analysis.

580 **3.2 Model Description**

model-description

581 **3.2.1 Transition To The Current Stock Assessment**

transition-to-the-current-stock-assessment

582 These are the main changes from the previous model, and our rationale for them:

- 583 1. Transition to Stock Synthesis. *Rationale*: The Pacific Fishery Management Council's
584 preferred modeling platform for stock assessments is Stock Synthesis (Methot 2015),
585 developed since the last full assessment of yellowtail rockfish.
- 586 2. Addition of Southern model. *Rationale*: Hess, et al. determined that the West Coast
587 yellowtail stocks show a genetic cline occurring near Cape Mendocino, which is roughly
588 40.10 north latitude (Hess et al. n.d.). This divides the stock into two genetically
589 distinct substocks which we model independently.
- 590 3. Availability of recent data. *Rationale*: Ten years of data collection have occurred since
591 the last update assessment, and the data necessary for an assessment of the Southern
592 stock is now available.
- 593 4. Historical catch reconstructions. *Rationale*: Reconstruction of catch timeseries in
594 California, Washington and Oregon clarify stock history as far back as 1898.

595 **3.2.2 Definition of Fleets and Areas**

definition-of-fleets-and-areas

596 **Northern Model**

597 *Commercial*: The commercial fleet consists primarily of bottom and midwater trawl. No
598 attempt was made to analyze the fishery separately by gear, particularly since it seems that
599 in the fishery in the 1980s and 1990s, “bottom trawl” gear was used in the midwater as well
600 as on the bottom, and “midwater gear” was sometimes dragged across soft bottoms (Craig
601 Goode, ODFW Port Sampler, pers. comm).

602 *At-Sea Hake Fishery*: Yellowtail Rockfish are frequently caught in mid-water trawls associated
603 with the At-Sea Hake Fishery (consisting of the Catcher-Processor and Mothership sectors).
604 These catches are recorded and biological sampling takes place but the fish are processed at
605 sea (typically into fish meal) and are not included in the PacFIN database so require separate
606 analysis.

607 *Recreational*: The recreational fleet includes data from sport fisheries off Washington, Oregon,
608 and northern California (Eureka and Del Norte counties)

609 *Research*: Research derived-data include observations from the West Coast Groundfish
610 Observing Program (WCGOP) which documents discarding in the commercial fishery, the

611 Alaska Fisheries Science Center's Triennial Trawl survey, and the Northwest Fisheries Science
612 Center's NWFSCcombo survey.

613 **Southern Model**

614 *Commercial*: The commercial fleet consists primarily of hook and line and trawl gear. Hook
615 and line gear account for 78% of the landings by weight in the recent period (1978-2016).

616 *Recreational*: The recreational fleet includes data from sport fishery off the California coast
617 south of Cape Mendocino.

618 *Research*: Research derived-data include observations from the Northwest Fisheries Science
619 Center's NWFSCcombo survey, and California Onboard recreational survey.

620 **3.2.3 Modeling Software**

modeling-software

621 The STAT team used Stock Synthesis 3 version 3(Methot 2015).

622 **3.2.4 Data Weighting**

data-weighting

623 Commercial and survey length composition and marginal age composition data are weighted
624 according to the method of Ian Stewart (pers.comm):

625 Sample Size = $0.138 * \text{Nfish} + \text{Ntows}$ if $\text{Nfish}/\text{Ntows} < 44$, and $\text{Ntows} * 7.06$ otherwise.

626 Age-at-Length samples are unwieghted; that is, each fish is assumed to represent an indepen-
627 dent sample.

628 Recreational trips (the analogue of tows in the commercial fishery) are difficult to define in
629 most cases. Since much of the recreational data are from the dockside interview MRFSS
630 program, which didn't anticipate the need to delineate samples as belonging to particular
631 trips, we chose to use all recreational data "as-is", with the initial weights entered as number
632 of fish.

633 Weighting among fleets uses either the Francis method (Francis 2011) or the Ianelli-McAllister
634 harmonic mean method (McAllister and Ianelli 1997). The Francis method was used for all
635 fleets, except for the age data from the Southern model's Hook and Line survey, which is a
636 single year of data to which we applied the Ianelli-McAllister method.

637 **3.2.5 Priors**

priors

638 Natural Mortality (M) priors were provide by Owen Hamel prior on natural mortality (Hamel
639 2015). Natural mortality priors were based on examination of 99% quantile of the observed
640 ages early in the time-series before the full impact of fishing would have taken place. For the
641 Northern model, these quantiles were approximately 35 years for females and 45 years for
642 males, resulting in median M values of 0.15 and 0.12 for females and males. For the Southern
643 model, the 99% quantile of the early age observations were approximately 30 and 40 years for
644 females and males, resulting in median M prior values of 0.18 and 0.135, respectively. In both
645 models, M for males was represented as an offset from females. In the Northern model, both
646 the female value and the male offset could be estimated without priors so the priors were not
647 used. For the southern model, M was fixed at the median prior values for the two sexes.

648 The prior for steepness (h, 0.718) was provided by James Thorson and used as a fixed
649 parameter in both models. <TOADS: Citation>

650 **3.2.6 General Model Specifications**

general-model-specifications

651 Citation for posterior predictive fecundity relationship from Dick (2009)

652 Model data, control, starter, and forecast files can be found at <https://DEVORE> .

653 **3.2.7 Estimated And Fixed Parameters**

estimated-and-fixed-parameters

654 A full list of all estimated and fixed parameters is provided in Tables.... Estimated and fixed
655 parameters tables currently read in from .csv file, EXAMPLE: Table ??

656 **3.3 Model Selection and Evaluation**

model-selection-and-evaluation

657 **3.3.1 Key Assumptions and Structural Choices**

key-assumptions-and-structural-choices

658 Selectivity in both models is asymptotic, with the exception of the OR-CA MRFSS recreational
659 fleet in the Northern model, and the Onboard recreational fleet in the Southern model.

660 **3.3.2 Alternate Models Considered**

alternate-models-considered

661 Time-blocked selectivity and retention were investigated in the Northern model, as were
662 domed selectivities.

663 We also explored time-blocks on selectivity in the Southern model, and domed selectivity for
664 the MRFSS/RecFIN data.

665 These approaches resulted in model fits to data that were obviously poor, and so they were
666 rejected

667 **3.3.3 Convergence**

convergence

668 Boilerplate, revisit:

669 Convergence testing through use of dispersed starting values often requires extreme values
670 to actually explore new areas of the multivariate likelihood surface. Jitter is a Stock
671 Synthesis option that generates random starting values from a normal distribution logically
672 transformed into each parameter's range (Methot 2015). Table 3 shows the results of running
673 100 jitters for each pre-STAR base model....

674 **3.4 Response To The Current STAR Panel Requests**
response-to-the-current-star-panel-requests

675 **Request No. 1: Add after STAR panel.**

676

677 **Rationale:** Add after STAR panel.

678 **STAT Response:** Add after STAR panel.

679 **Request No. 2: Add after STAR panel.**

680

681 **Rationale:** Add after STAR panel.

682 **STAT Response:** Add after STAR panel.

683 **Request No. 3: Add after STAR panel.**

684

685 **Rationale:** Add after STAR panel.

686 **STAT Response:** Add after STAR panel.

687 **Request No. 4: Example of a request that may have a list:**

688

- 689 • **Item No. 1**
690 • **Item No. 2**
691 • **Item No. 3, etc.**

692 **Rationale:** Add after STAR panel.

693 **STAT Response:** Continue requests as needed.

719 **5 Regional Management Considerations**

720 regional-management-considerations

- 721 1. For stocks where current practice is to allocate harvests by management area, a
722 recommended method of allocating harvests based on the distribution of biomass should
723 be provided. The MT advisor should be consulted on the appropriate management
724 areas for each stock.
- 725 2. Discuss whether a regional management approach makes sense for the species from a
726 biological perspective.
- 727 3. If there are insufficient data to analyze a regional management approach, what are the
research and data needs to answer this question?

₇₂₈ **6 Research Needs**

figures

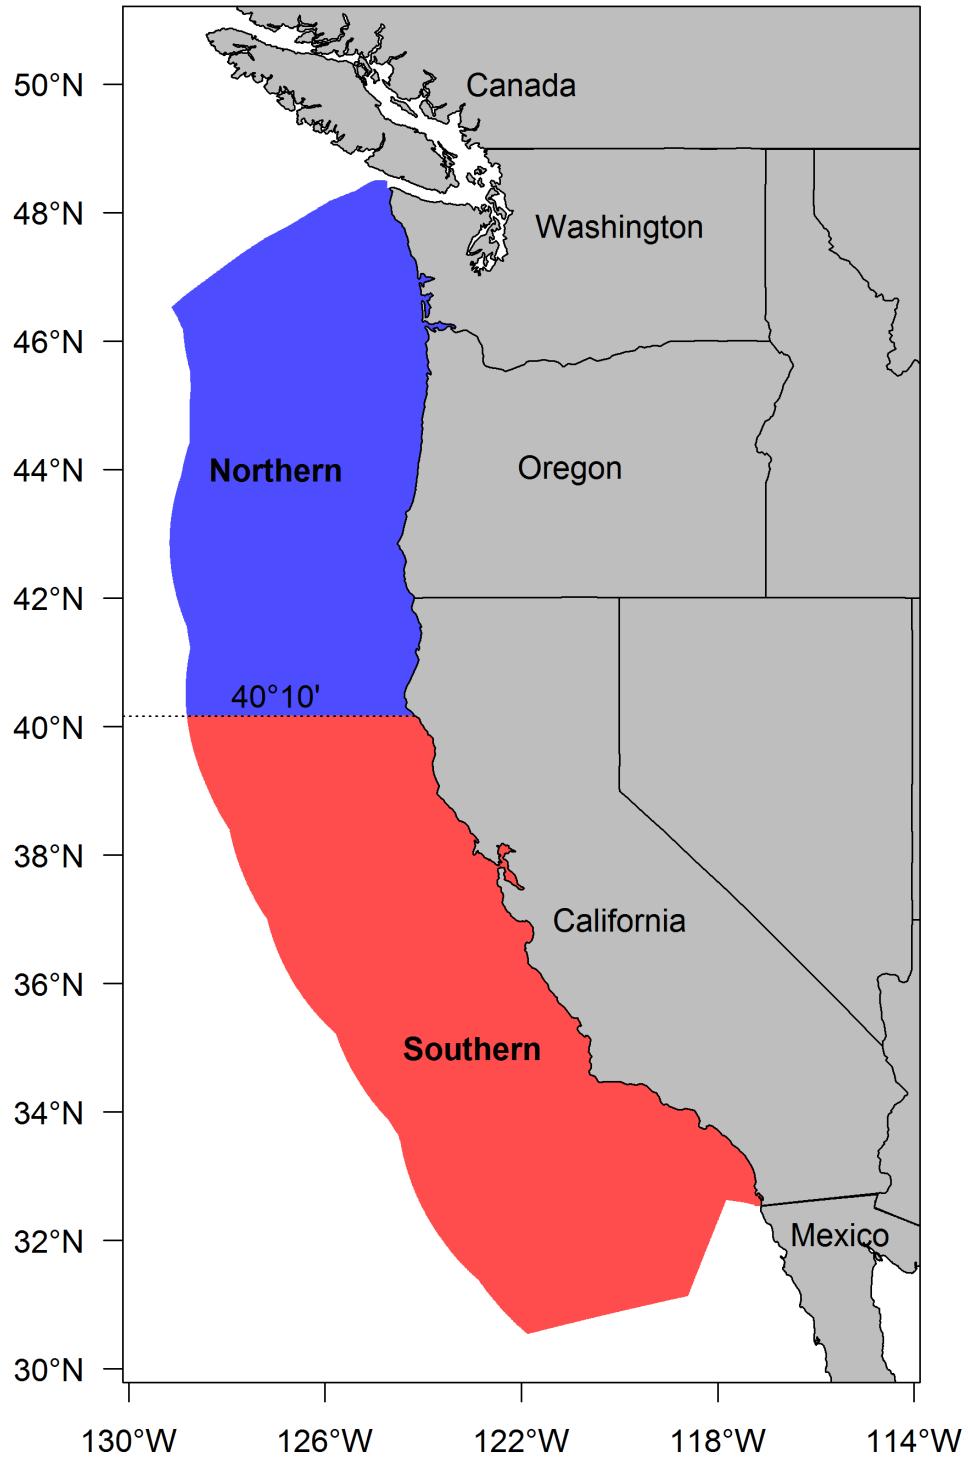

Figure 1: Map depicting the boundaries for the base-case model. fig:assess_region_map

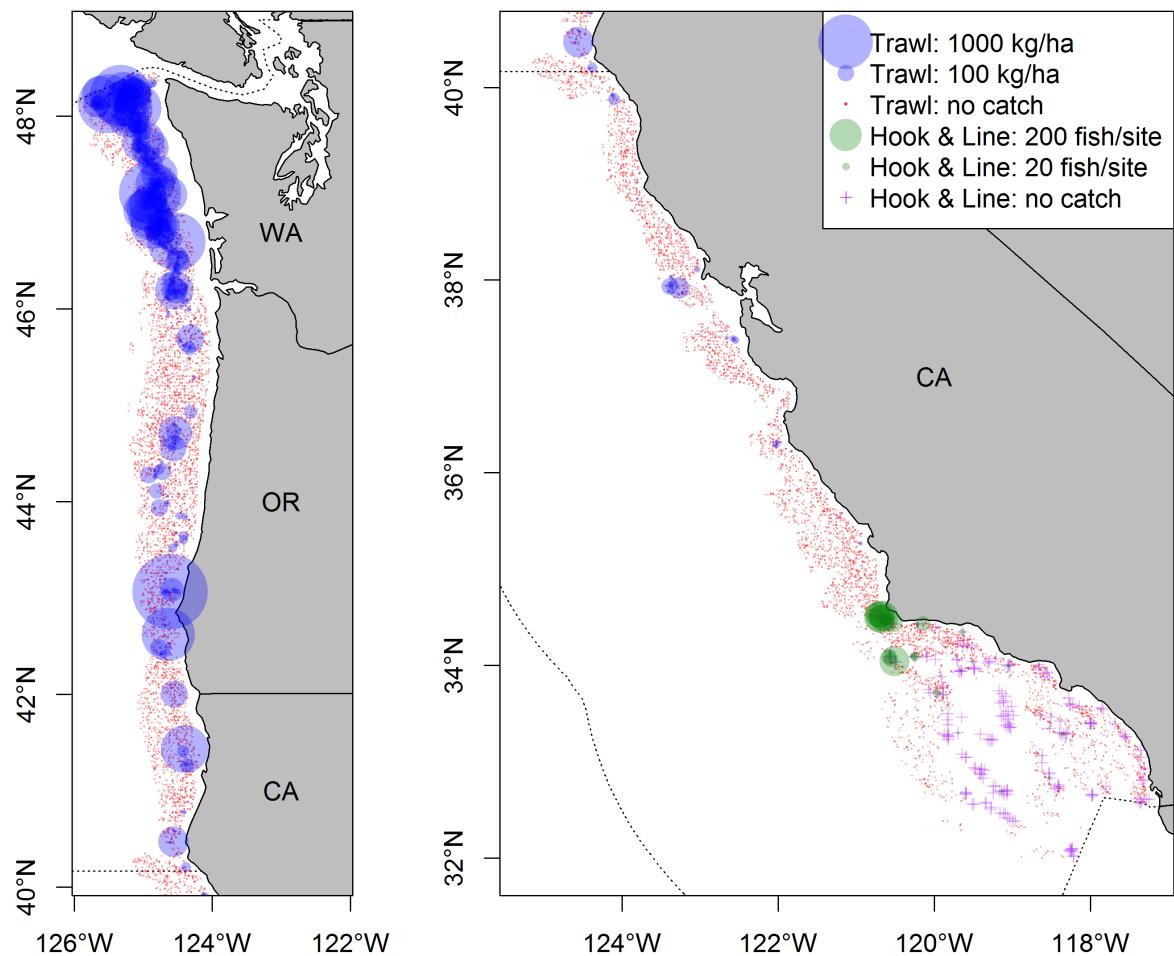

Figure 2: Map showing observations of Yellowtail Rockfish in the NWFSCcombo trawl survey and Hook & Line survey. [fig:assess_region_map](#)

751 9.1 Life history (maturity, fecundity, and growth) for both models
life-history-maturity-fecundity-and-growth-for-both-models

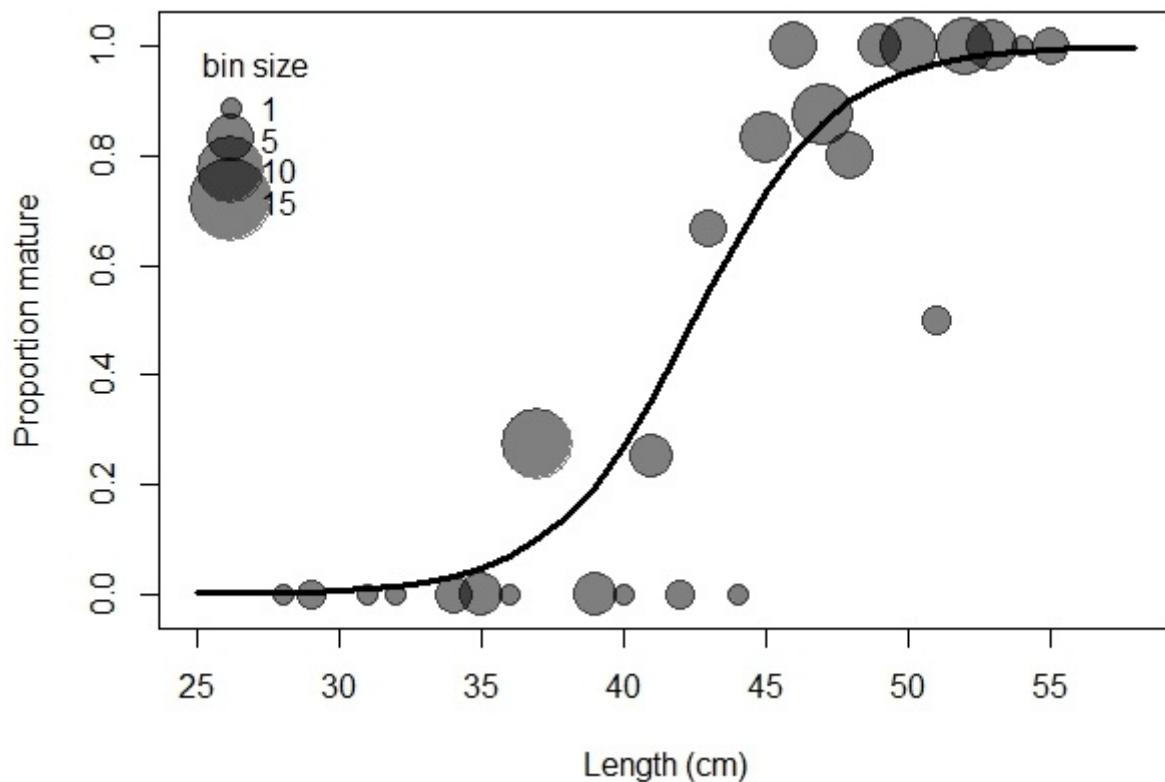

Figure 3: Estimated maturity relationship for Yellowtail Rockfish used in both models. Gray points indicate average observed functional maturity within each length bin with point size proportional to the number of samples.
fig:maturity

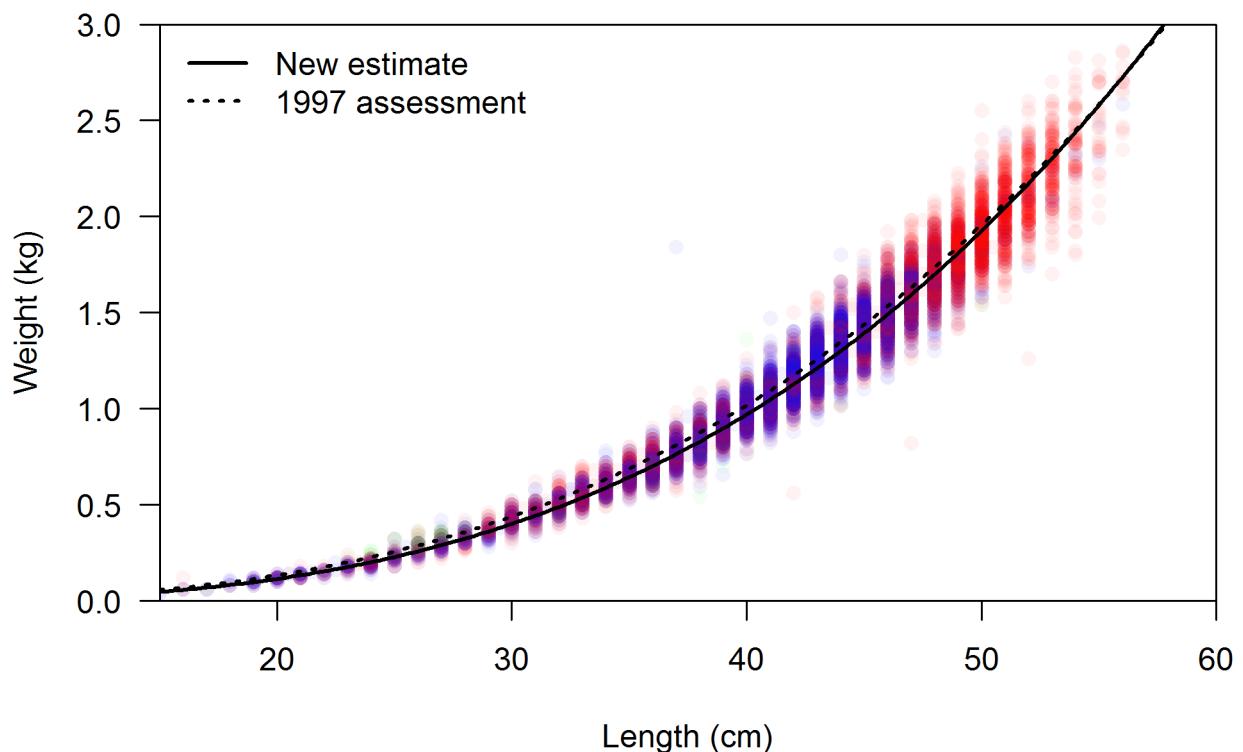

Figure 4: Estimated weight-length relationship for Yellowtail Rockfish used in both models. Colored points show observed values (red for females, blue for males, and green for unsexed). The black line indicates the estimated relationship $W = 0.000011843L^{3.0672}$.
fig:weight-length

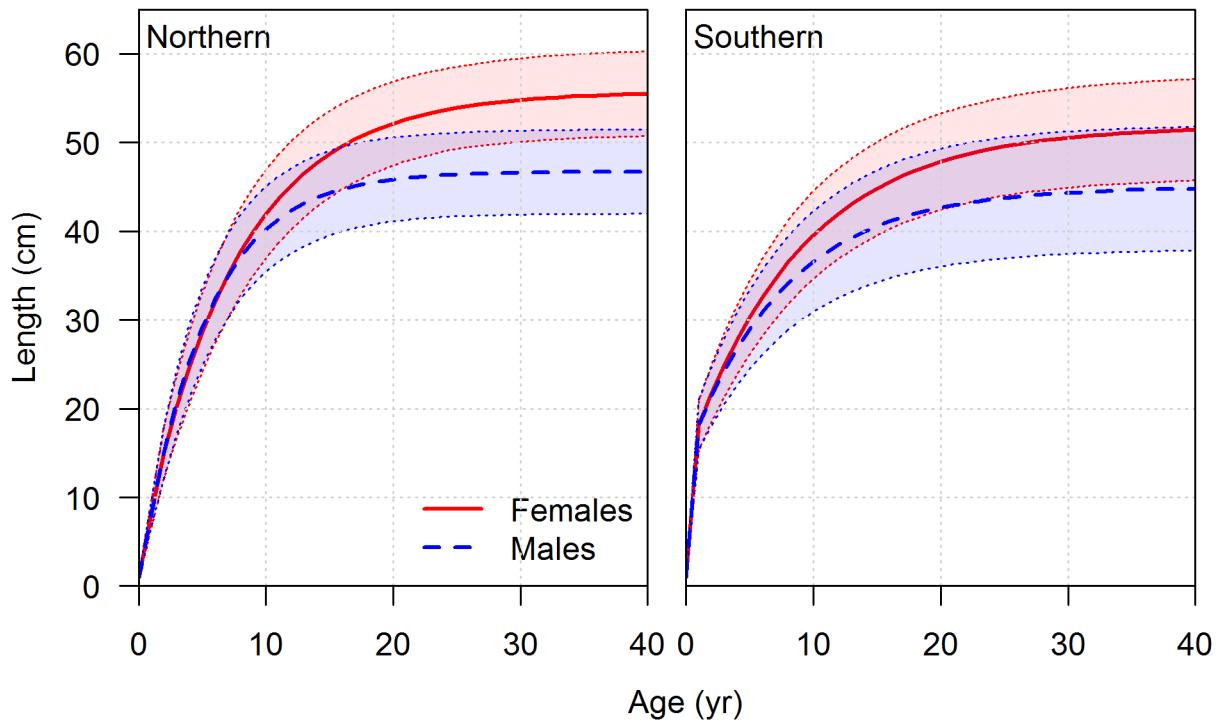

Figure 5: Estimated length-at-age for female and male Yellowtail Rockfish in each model. Shaded areas indicate 95% intervals for distribution of lengths at each age. Values represent beginning-of-year growth. fig:growth

752 9.2 Data and model fits for the Northern model
[data-and-model-fits-for-the-northern-model](#)

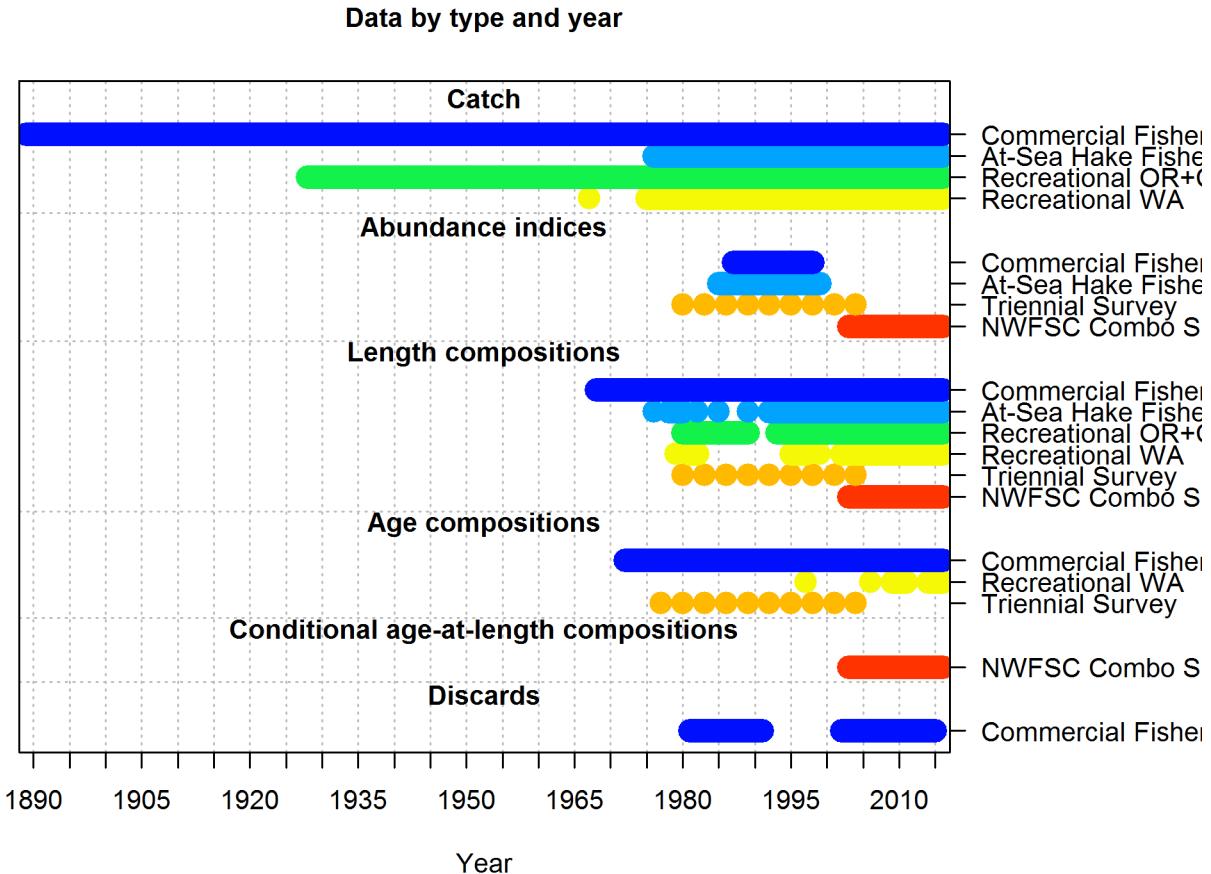

Figure 6: Summary of data sources used in the Northern model. [fig:data_plot](#)

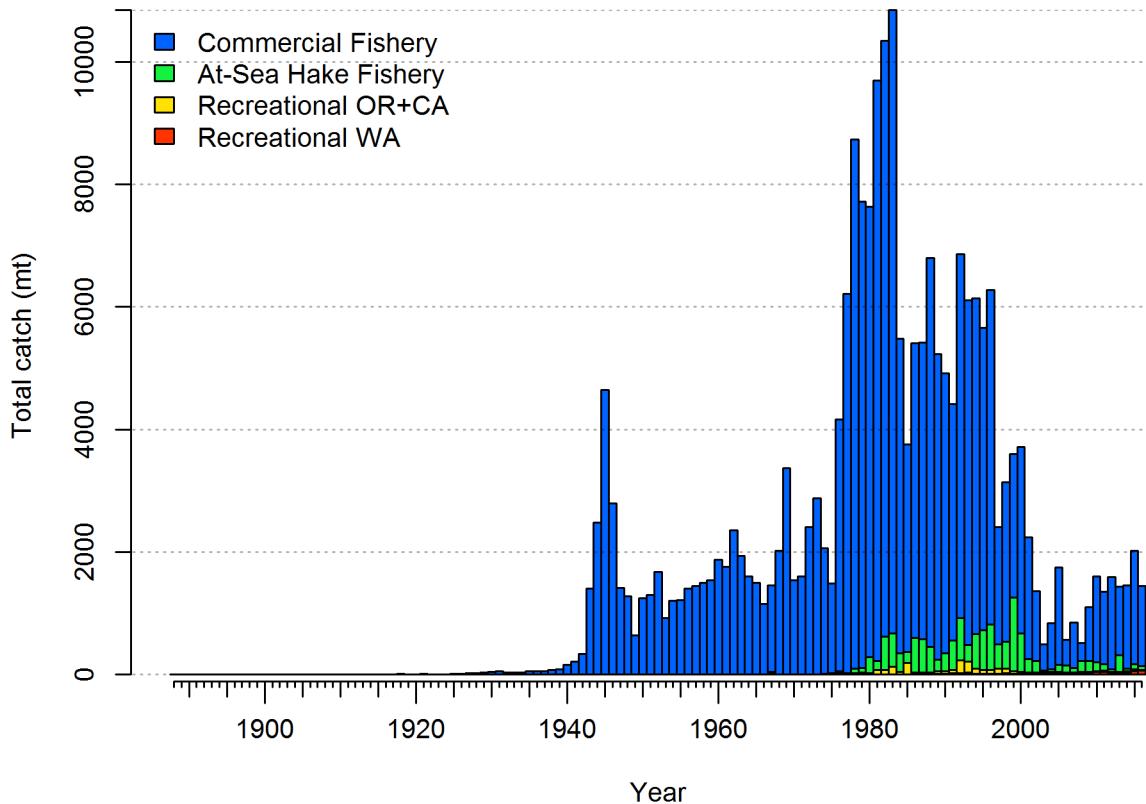

Figure 7: Estimated catch history of Yellowtail Rockfish in the Northern model. Recreational catches in Washington are model estimates of total weight converted from input catch in numbers using model estimates of growth and selectivity. Catches for the Commercial Fishery include estimated discards.
`fig:r4ss_total_catch_N`

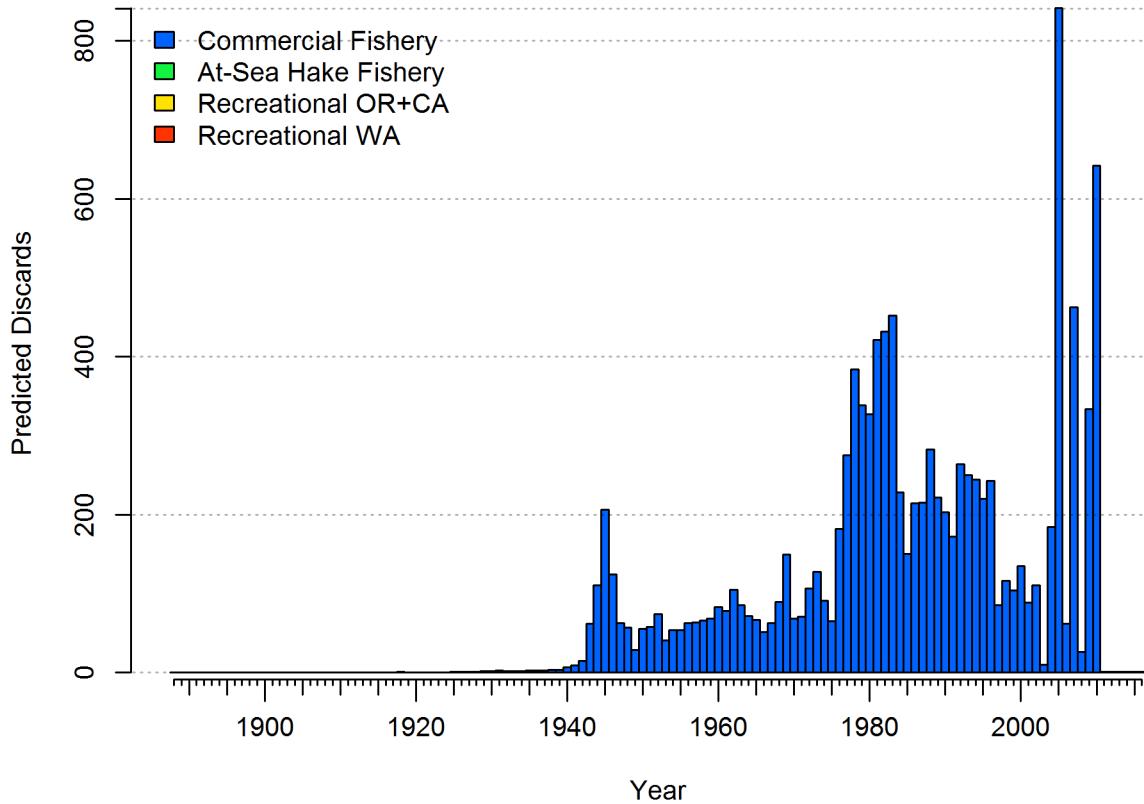

Figure 8: Estimated discards in the Commercial Fishery in the Northern model. Estimates are influenced by the data for landings, discard ratios, and discard length combines and depend on the estimated parameters controlling selectivity and retention.^{fig:r4ss_discard_N}

753 9.2.1 Selectivity, retention, and discards for Northern model
[selectivity-retention-and-discards-for-northern-model](#)

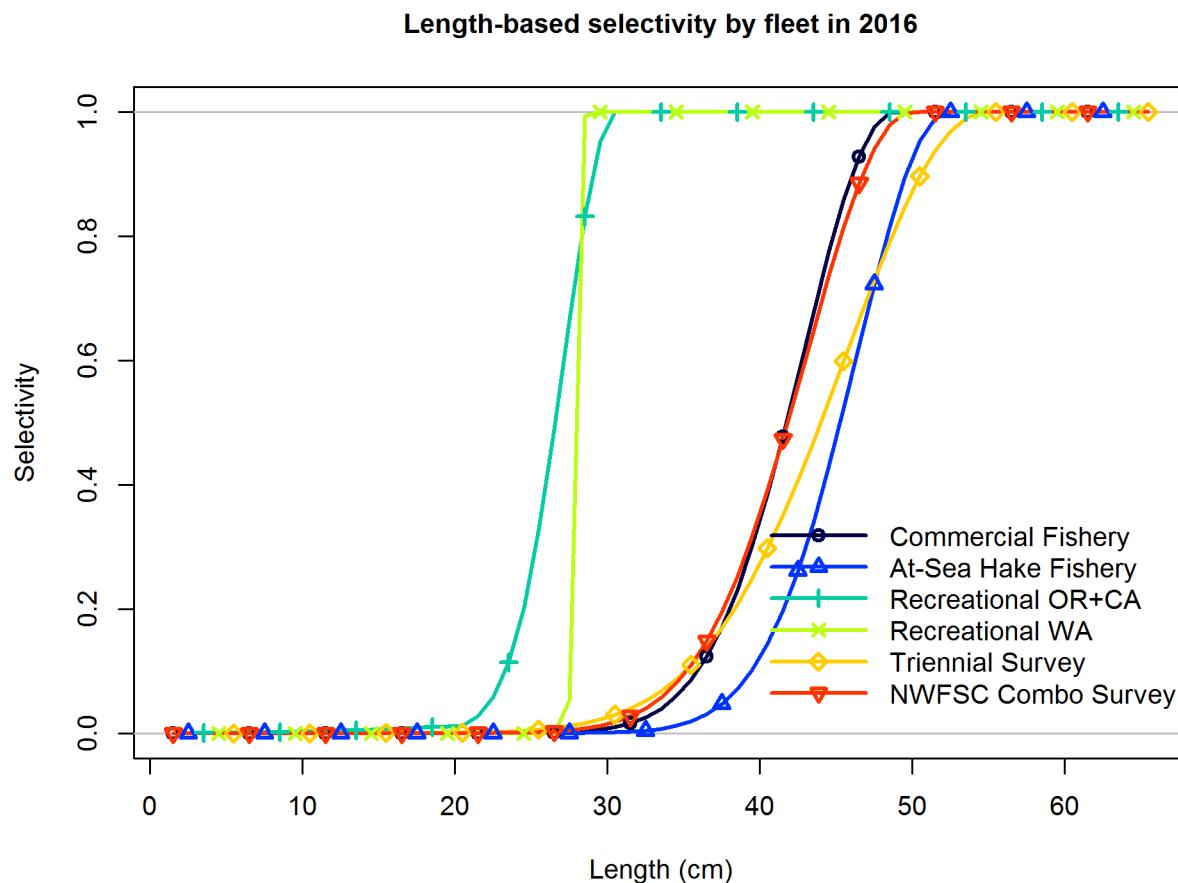

Figure 9: Estimated selectivity by length by each fishery and survey in the Northern model. [fig:selex](#)

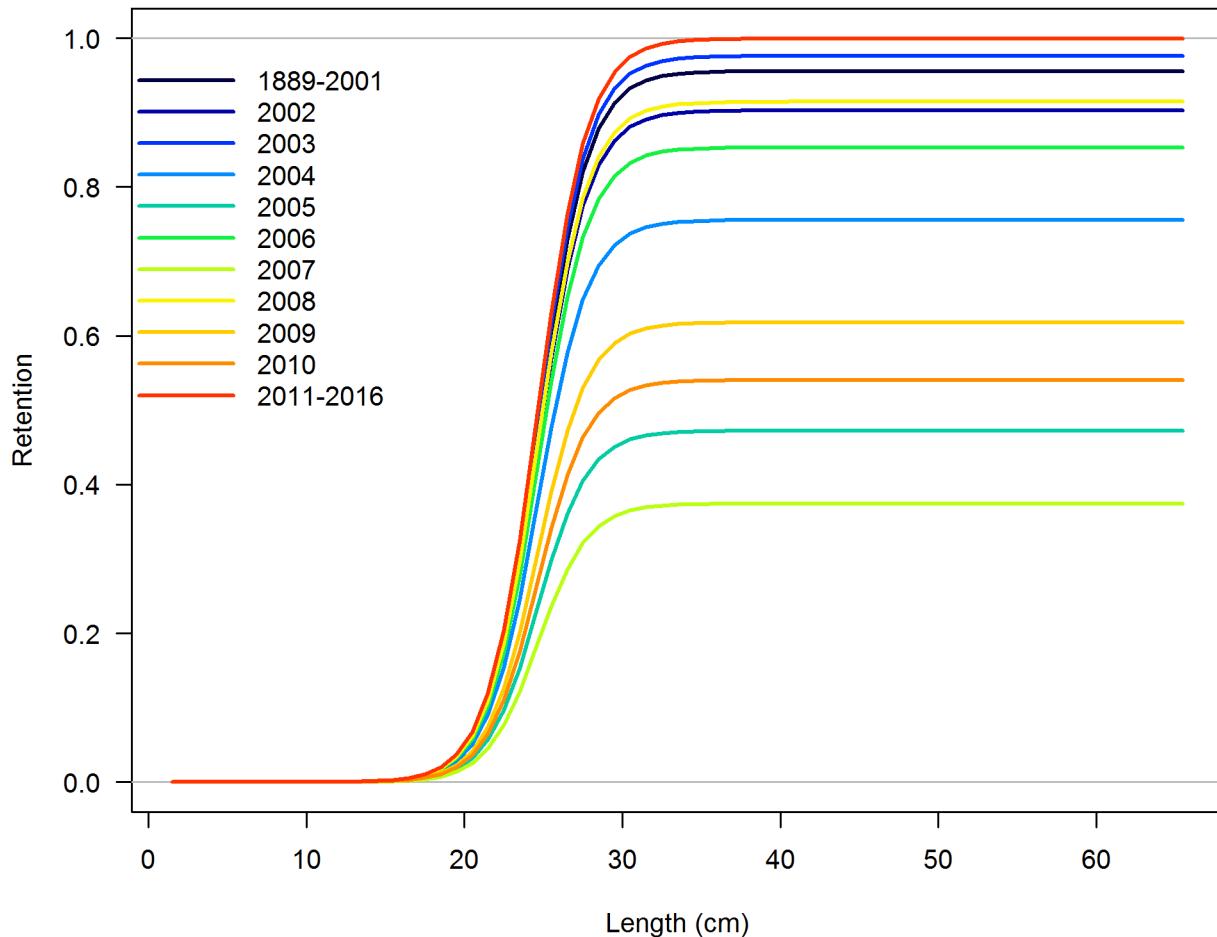

Figure 10: Estimated retention by length by the Commercial Fishery in the Northern model. `fig:retention`

Discard fraction for Commercial Fishery

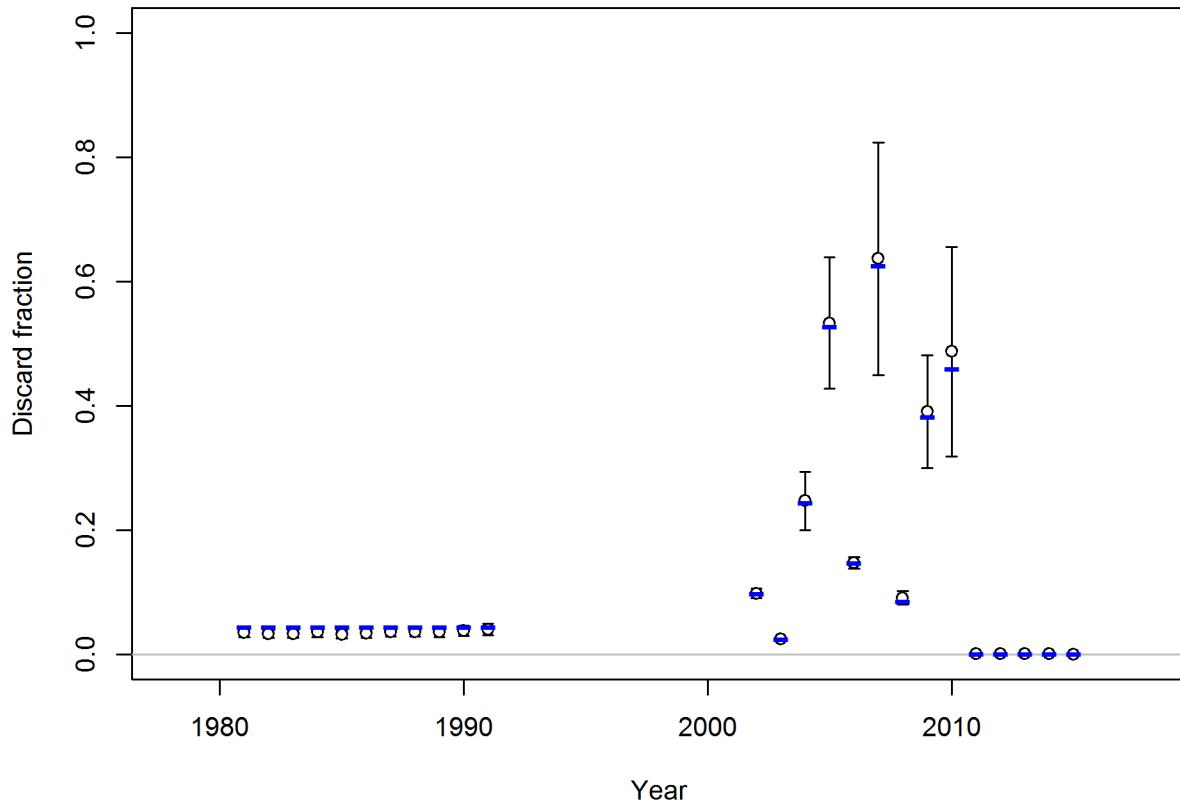

Figure 11: Fit to discard fractions for the commercial fishery in the Northern model.^{fig:r4ss_discard}

754 9.2.2 At-Sea Hake Bycatch Index

at-sea-hake-bycatch-index

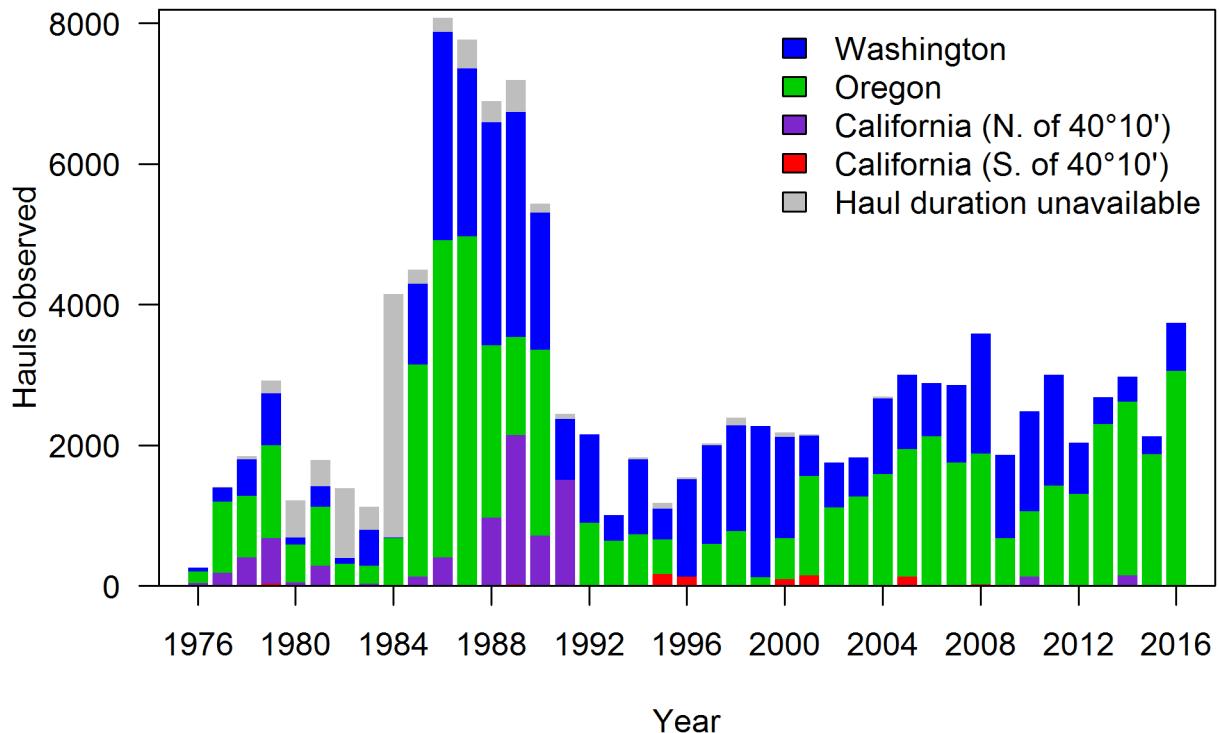

Figure 12: Number of observed hauls from the at-sea hake fishery classified by location relative to Washington, Oregon, and California (north and south of 40°10'). Grey bars indicate observed tows with no haul duration available which were excluded from the CPUE analysis.
fig:ASHOP_X1

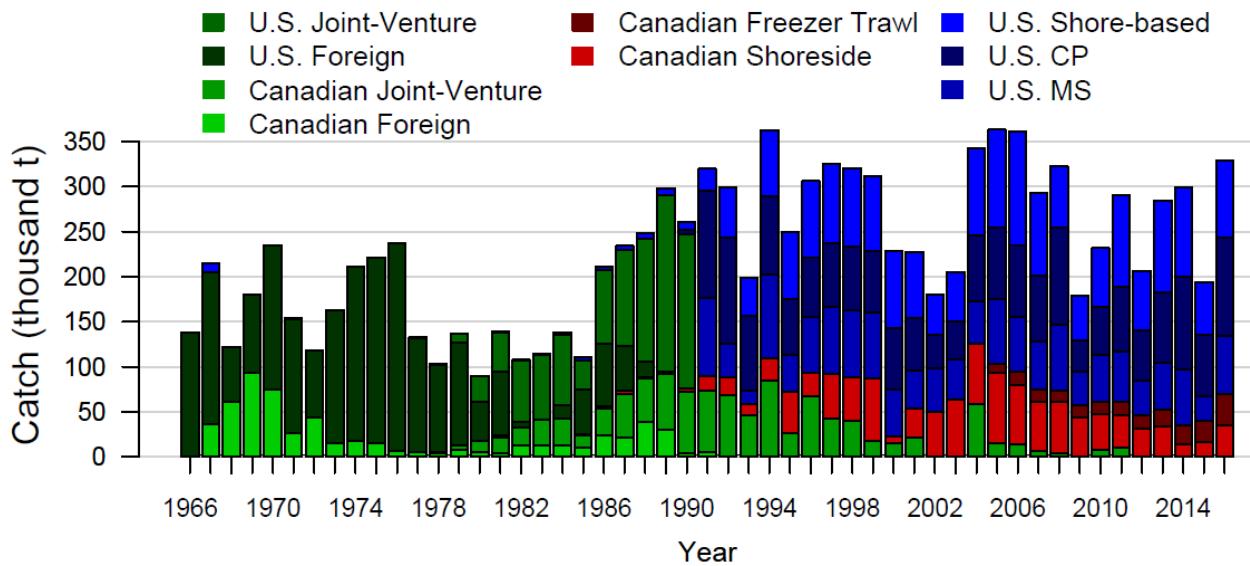

Figure 13: Catch history for Pacific Hake by sector. Data used in the CPUE analysis are from the “U.S. Joint-Venture” and “U.S. Foreign sectors” through 1990 and from the Catcher-Processor (“U.S. CP”) and Mothership (“U.S. MS”) sectors from 1990 onward.^{fig:ASHOP_X2}

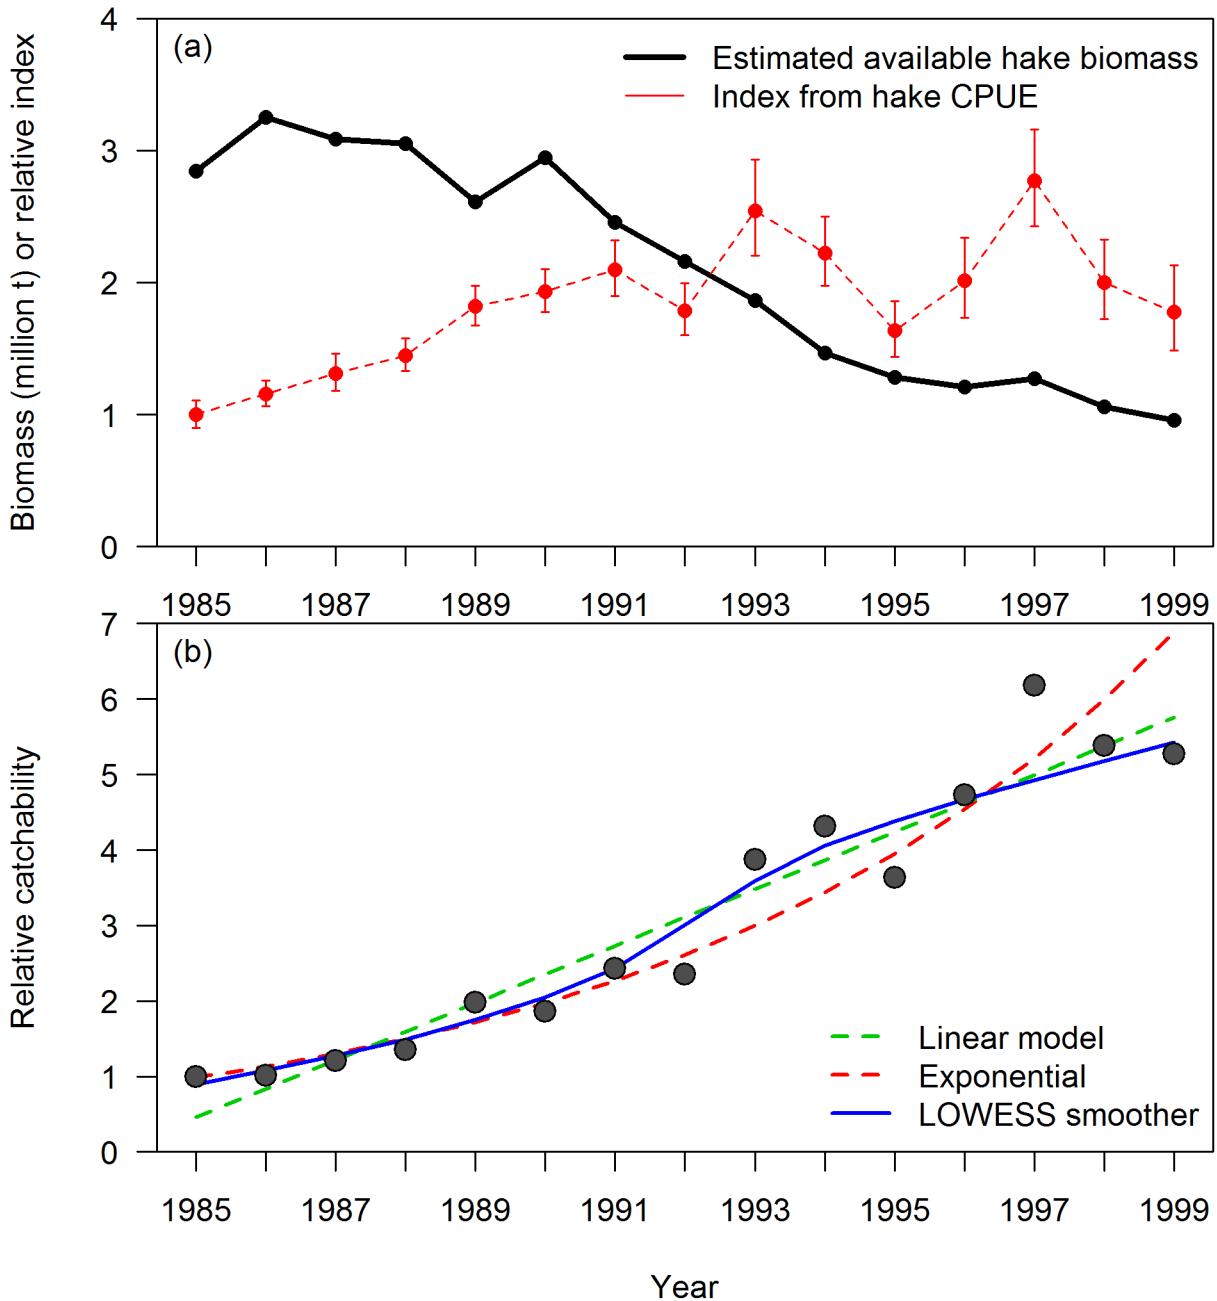

Figure 14: Geostatistical index for Pacific Hake developed using VAST compared to the estimated available hake biomass.
fig:ASHOP_X3

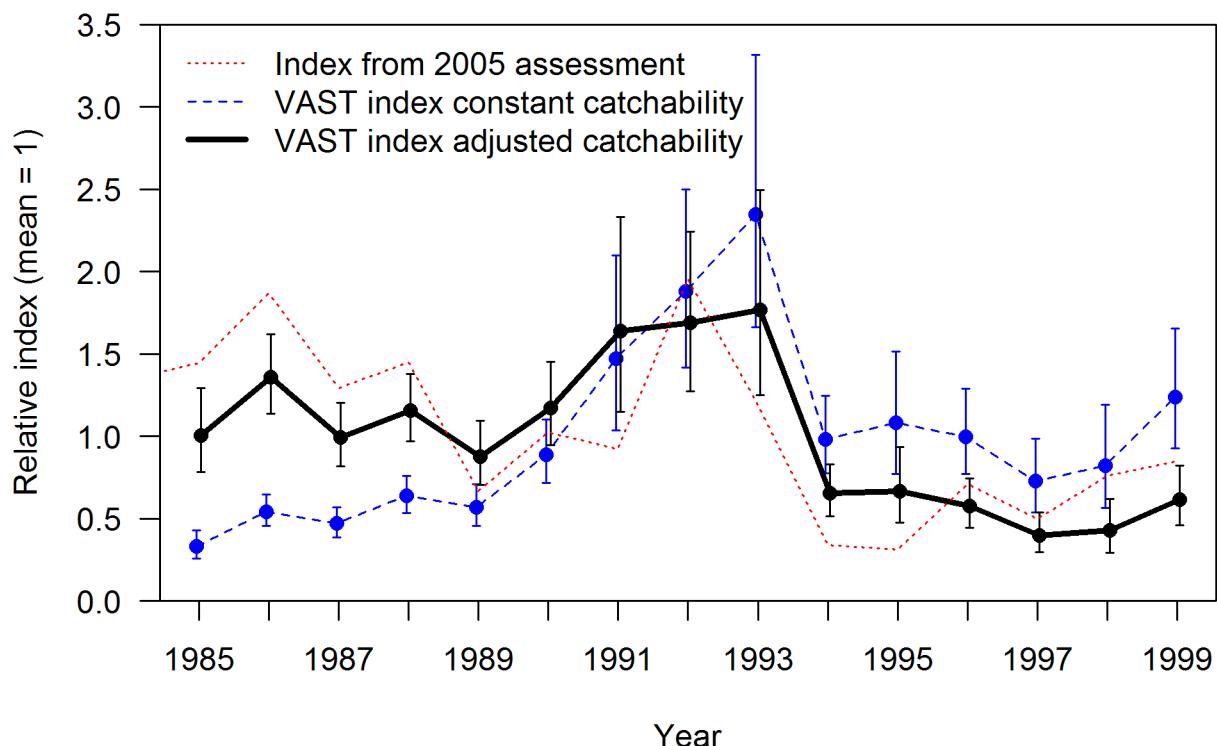

Figure 15: Index from the geostatistical model VAST with constant catchability and adjusted for the estimated increase in catchability (previous figure). These are compared to the index from the most recent yellowtail assessment (Wallace and Lai, 2005).
fig:ASHP_X4
